Birmingham, Jefferson County, Alabama

USEPA ID No. ALD 000 828 848

Terracon Project No. E1137227

Dear Mr. Hardegree:

On behalf of ERP Compliant Coke, LLC (ERP Coke), Terracon Consultants, Inc. (Terracon) is pleased to submit the enclosed revisions to the *Corrective Measures Study SMA 4 – Former Chemical Plant (Revision 1.1)* for the above-referenced site. These revisions have been prepared in response to Final Comments dated 3/3/17 for the Corrective Measures Study for SMA 5 Former Pig Iron Foundry and SMA 4 – Former Chemical Plant from the United States Environmental Protection Agency (USEPA) Region 4. The individual comments and responses are provided below.

Section 3.0 – Baseline Risk Assessment

USEPA Comment No. 1

Preliminary Cleanup Standards, SMA 4: EPA's review of the Preliminary Cleanup Standards (PCSs) found the following:

- a. PCSs for SMA-4 groundwater (Table 3-24). Based on the listed exposure point concentrations and the site risks shown, EPA's risk assessor could verify some of the listed PCS values (e.g., Benzene, vinyl chloride), but other PCS values in this table could not be reproduced (e.g., Benzo(a)pyrene, Benzo(b)fluoranthene, Naphthalene, Toluene). Some of the values listed may be an issue of units (i.e., value shown would appear to be correct if the units were mg/L, but are not correct for ug/L)?

- b. It is recommended that the preparer of the report recheck ALL values in this table. Also it would be helpful to add a column to list available health-based Maximum Contaminant Levels (MCLs) (Primary MCLs) since I assume MCLs would be selected as cleanup levels.

ERP Coke Response No. 1

Table 3-24 has been revised to include MCL and the values were checked for correctness based on concentrations presented as ug/L.

Section 4.0 Identification and Development of Preliminary Cleanup Standards and General Response Actions

USEPA Comment No. 2

Section 4.2.1 (Surface Soil), SMA 4: In discussing surface soil requiring remediation, the CMS Report includes the following statement: "The surface soil COCs above the PCS are presented in Table A-1 and on Figure 4-1. However, since the cumulative ELCR was below 10^{-4} and the HI was less than 1.0, surface soil contamination is not deemed to be a principle threat in need of active remediation." Basically, the report is concluding that although remediation is needed based on a comparison of the cumulative site risk to the EPA trigger levels, surface soil remediation is not needed (i.e., a risk management decision). As discussed in the March 1st meeting, there may be a few more reasons that could be added to support a no action decision (e. g., recent updates to PAH toxicity).

ERP Coke Response No. 2

Section 4.2.1 has been revised to discuss additional reasons supporting no active surface soil remediation.

USEPA Comment No. 3

Section 4.2.2 (Subsurface Soil), SMA 4: In discussing subsurface soil requiring remediation, the CMS Report includes the following statement: "The subsurface soil COCs above the PCS are presented in Table A-2 and on Figure 4-2. The cumulative ELCR was below 10^{-4} and the cumulative HI was less than 1.0." Is subsurface soil remediation needed to address human health risk? Similar to the discussion of surface soil in Section 4.2.1, should Section 4.2.2. of the report present a conclusion as to whether subsurface soil remediation is needed? If yes, please add reasons to support a risk management decision to take no action.

ERP Coke Response No. 3

Section 4.2.2 has been revised to discuss additional reasons supporting no active subsurface soil remediation.

USEPA Comment No. 4

Sections 6.2.4.2, 6.2.5.3 (In-Situ Subsurface Soil Treatment), SMA 4: There seems to be a slight conflict (potential confusing point) in use of “subsurface soil” in these two alternatives. In Sections 4.2.1 and 4.2.2, the apparent intent of the CMS Report is to conclude that active soil remediation is not needed to address human health risk from surface and subsurface soil above the Preliminary Cleanup Standards. However, Sections 6.2.4.2 and 6.2.5.3 both discuss addressing subsurface soil. Is the subsurface soil discussed in Sections 6.2.4.2 and 6.2.5.3 really subsurface source material contributing to the groundwater contamination and not subsurface soil being treated to address human health exposure risk noted in Section 4.2.2? Could some other term/phrase be used to distinguish between 1) subsurface soil and 2) subsurface source material that is contributing to groundwater contamination? Maybe use of the term “source area” (defined to include both subsurface source material in the soil and its associated and concentrated nearby groundwater contamination) could help with distinguishing between those subsurface areas in need of treatment and more dispersed subsurface soil contamination.

ERP Coke Response No. 4

These Sections have been revised to address In-Situ Soil Source Area Treatment instead of In-Situ Subsurface Soil Treatment. The entire sections have been revised to make it clear that we are referring to in-situ treatment of the soil source areas and associated groundwater in those areas in order to prevent leaching of chemicals into the groundwater and not for cleanup of the subsurface soil in general since the subsurface soil itself did not pose a risk to human health based on the HHRA.

USEPA Comment No. 5

Sections 6.2.4.2 and 6.2.5.2: Section 6.2.4.2 discusses in-situ treatment of subsurface soil and groundwater while Section 6.2.5.2 discusses in-situ treatment of only subsurface soil. Should Section 6.2.5.2 be equivalent to Section 6.2.4.2 (i.e., in-situ treatment for both soil and groundwater)? Could use of “in-situ source area treatment” (which includes both soil and highly concentrated nearby groundwater) be used to help with distinguishing subsurface areas in need of treatment from more dispersed subsurface soil contamination?

ERP Coke Response No. 5

These Sections have also been revised to address In-Situ Soil Source Area Treatment instead of In-Situ Subsurface Soil Treatment. The entire sections have been revised to make it clear that we are referring to in-situ treatment of the soil source areas and associated groundwater in those areas in order to prevent leaching of chemicals into the groundwater and not for cleanup of the subsurface soil in general since the subsurface soil itself did not pose a risk to human health based on the HHRA.

Section 7.0 — Evaluation of the Corrective Action Alternatives

Section 8.0 — Justification and Recommendation of the Corrective Measures

USEPA Comment No. 6

Recommended Remedy, SMA 4: The last two evaluated remedies are of most interest to EPA. CAA4 is titled Land Use Controls, In-situ subsurface Soil Treatment, In-situ Groundwater Treatment and Groundwater Monitoring. The recommended remedy is CAAS, which is tilted Land Use Controls + In-Situ Subsurface Soil Treatment + Groundwater Removal and Treatment + Groundwater Monitoring. EPA is interested in understanding how the in-situ subsurface soil treatment is going to occur separate from and without also including in-situ groundwater treatment? As previously expressed (e.g., Global Comments 23 and 32 from EPA Comment Letter dated 8/26/16), EPA is concerned that the groundwater removal alone will not be sufficient cleanup the groundwater due to subsurface sources remaining. Does the recommended remedy's (CAA 5) reference to In-Situ Subsurface Soil Treatment also encompass In-Situ Groundwater Treatment?

ERP Coke Response No. 6

This section has been updated to include groundwater in-situ treatment in the areas of soil source area treatment since an ancillary benefit of treating source soil will be some treatment of the collocated groundwater.

USEPA Comment No. 7

Recommended Remedy, SMA 4: The type of in-situ source area (soil and nearby groundwater) treatment, either chemical or biological, will be determined through later field work. Currently, the CMS Report provides two broad categories of in-situ treatment - chemical, biological. The report should include a little more detail as to the types of chemical or biological treatment that will be investigated during the Corrective Measures Implementation (CMI) phase.

ERP Coke Response No. 7

A list of potential chemical and biological treatments has been added to Section 8.1.

USEPA Comment No. 8

Post-Remedy Selection (i.e., Remedy Implementation), SMA 4 and 5: FYI: After EPA issues its Response to Comments (RTC) and Final Decision document selecting the remedy, a Corrective Measures Implementation (CMI) plan will be needed. The CMI plan will need to include the following, at a minimum:

- a. A description of the conceptual design, technical features (e.g., plans and specifications, including any treatability studies) and a construction plan for the selected remedy(ies) to achieve media cleanup standards protective of human health and the environment, controlling the source(s) of the release, and complying with standards for the management of wastes and any remedial residues;
- b. A proposed schedule that takes into account all phases of the CMI. The schedule should also include the submittal of documents to support the CMI (e.g., operation and maintenance plan, construction completion report); and
- c. Requirements for removal and decontamination of units, equipment, devices, and structures that will be used to implement the remedy(ies).

ERP Coke Response No. 8

Section 8.2 has been added to incorporate the post-Remedy Selection process.

CLOSING

If you should have any questions, please do not hesitate to contact us at (205) 942-1289.

Sincerely,

EXECUTIVE SUMMARY

Background

Under the September 24, 2012 Administrative Order on Consent (2012 AOC) between Walter Coke, Inc. and EPA, the Former Chemical Plant (FCP) is Solid Waste Management Unit (SWMU) Management Area (SMA) 4. This CMS is for SMA 4 and is submitted on behalf of ERP Compliant Coke, LLC (ERP Coke). (ERP Coke acquired certain assets of Walter Coke, Inc., including the facility at which SMA 4 is located, in a transaction in which ERP Coke agreed to implement the 2012 AOC.) SMA 4 contains twelve SWMUs and two Areas of Concern (AOCs):

- n SWMU 26 – Main Process Building
- n SWMU 27 – Floor Drain System
- n SWMU 28 – Sulfonation Floor Drain
- n SWMU 29 – Product Tank Containment Area
- n SWMU 30 – Centrifuge Waste Water Tank
- n SWMU 31 – Monohydrate Floor Drain and Sump
- n SWMU 32 – Drum Storage Area
- n SWMU 33 – Plant Drum Storage Area
- n SWMU 34 – Wastewater Neutralization System
- n SWMU 35 – Mineral Wool Piles
- n SWMU 36 – Used Oil Tank
- n SWMU 42 – Former Above Ground Storage Tanks (ASTs)
- n AOC B – Drainage Ditch next to Shuttlesworth Drive and 35th Avenue
- n AOC D – Former Chemical Plant (FCP) Groundwater Plume

The operation of the facility now owned by ERP Coke can be traced back to 1881 when Sloss-Sheffield Steel and Iron Company first began producing pig iron in Birmingham, Alabama. In 1920, Sloss-Sheffield Steel and Iron Company built two modern coke oven batteries, at the time in North Birmingham, to serve its own needs as well as those of other customers. As Birmingham's steel industry grew, so did the need for furnace coke, which prompted the construction of three more batteries at the site during the 1950s.

The original coke manufacturing facility began operation in 1920 as Sloss Sheffield Steel and Iron Company. Beginning in 1952, the company experienced a series of corporate reorganizations and several name changes. Then, in February 2016, the facility was purchased by ERP Coke. The following operations have occurred at the facility:

- n The biological treatment facility (BTF), designed to treat wastewater generated at the facility, was constructed in 1973-74, first received wastewater in 1975 and is still in operation today. SMA 1 includes the BTF Process Area.
- n Land Disposal Areas (LDAs) have been used at various times over the life of the facility. Biological sludge, blast furnace sludge, and construction and demolition debris have been placed in the land disposal areas. SMA-2 includes the LDAs.
- n Coke manufacturing has occurred since 1920 and 120 coke ovens continue to operate. SMA-3 includes the Coke Manufacturing Plant.
- n Chemical manufacturing began at the facility in 1948 and all chemical manufacturing operations ceased in 2002. In addition, a mineral wool plant which manufactured mineral fiber used in the production of ceiling tile and insulating products was built in late 1947 and was decommissioned in 2010. SMA-4 includes the FCP and the mineral wool piles.
- n An iron blast furnace that produced pig iron from iron ore began operation in 1958; blast furnace operations ceased in 1981, and the blast furnace was decommissioned in 1984. SMA-5 includes the Former Pig Iron Foundry.

A RCRA Section 3008(h) Administrative Order on Consent (Order) with the effective date of September 24, 2012, was signed by Walter Coke (and ERP Coke has agreed to implement the 2012 AOC as a condition of its purchase of certain Walter Coke assets) and the EPA. In the 2012 AOC, there are 45 SWMUs and 6 AOCs, all consolidated into 5 SMAs, listed at the facility.

Key Conclusions from this CMS

1. The CMS shows that no corrective action is needed in SMA 4 to address off-site residents. The CMS shows that any risks are so low as to be negligible because:
 - a) The calculated risk associated with the Mineral Wool Piles is acceptable according to EPA criteria and essentially approaches zero. And even this calculated risk likely overstates actual risk because the calculations used standard assumptions for residential exposure that likely substantially overstate exposure compared to reality because (i) the Mineral Wool Pile is not residential soil and emissions, if any, from the Mineral Wool Piles would experience

- dispersion before reaching any residence and (ii) the Mineral Wool Piles, unlike soil, form a crust and have a vegetative cover that significantly lowers the potential for emissions.
- b) The results of the completed Vapor Intrusion Study for the area just past the facility boundary to the east concluded that off-site vapor intrusion is likely not occurring and, as EPA has agreed, does not warrant further action.
 - c) There are no other media in SMA 4 that off-site residents could plausibly be exposed to.
2. The risk to industrial workers from the Mineral Wool Piles is also acceptable according to EPA criteria and does not warrant any action on the Piles. That no action is needed to address the Mineral Wool Piles is consistent with past correspondence with EPA confirming the product's benign nature.
 3. Any risks to human health or the environment from SMA 4 surface and subsurface soils do not warrant corrective action as long as the site is nonresidential because risks from these soils fall within EPA's acceptable range for industrial and construction workers. Recommended land-use controls will ensure that the site remains nonresidential.
 4. In-situ treatment is recommended for certain soil source areas in order to address the potential for leaching from those soils into groundwater. The goal of treatment will be to lower soil concentrations of the relevant contaminants to below the leachability screening levels on a domain averaging basis. In addition, groundwater in the area of the soil source areas will receive some treatment as an ancillary benefit of this soil treatment. This will in turn help to reduce contaminant mass within the groundwater plume. This treatment will help ensure the effectiveness of the recommended groundwater remedy.
 5. A pump and treat remedy is recommended for groundwater in SMA 4 in order to attempt to restore groundwater to the extent feasible and to address the calculated assumed risk to construction and industrial workers. Although addressing these calculated risks to construction and industrial workers is one of the goals of the recommended groundwater corrective action, the CMS likely overstates the risks to these workers for at least the following reasons:
 - a) As to construction workers, no construction projects are planned in SMA 4, and if any occur before corrective action is completed, the recommended land use control plan would mitigate risks with measures like PPE requirements and/or excavation permits.
 - b) As to current industrial workers, the only potentially complete groundwater exposure pathway is vapor intrusion. Currently, the groundwater removal interim measure is remediating groundwater and thereby reducing risk from vapor intrusion, and it will continue to do so as the recommended corrective action. In addition, the location, nature, and use of existing structures nearest to the SMA 4

groundwater plume are such that vapor intrusion from SMA 4 may not be occurring in those structures or that any vapor intrusion or vapor intrusion exposure occurring in them may be considerably less extensive than EPA's standard assumptions that are used in this CMS.

- c) For future industrial workers, the vapor intrusion considerations applicable to current industrial workers apply. Also, though, these workers were assumed to use groundwater for potable purposes like showering, but such use of groundwater does not currently occur, is unexpected and extremely unlikely, and would be contrary to generally applicable local law that prohibits the use of groundwater for potable purposes. Thus, the calculated risks associated with a future industrial worker's use of groundwater for potable purposes are purely hypothetical. Even so, the recommended corrective action will reduce these risks.

Overview of CMS Analyses

A human health risk assessment (HHRA) is presented in this CMS. The HHRA was prepared to determine if constituents detected exceed carcinogenic risks of $1E-06$ and/or noncarcinogenic hazard quotients in excess of 0.1 based on certain conservative exposure assumptions. Site media included in the risk assessments included soil, groundwater, and the Mineral Wool Piles.

In addition, cleanup goals were calculated for constituents that exceeded the carcinogenic and noncarcinogenic risk thresholds for receptors for which the site-wide calculated or assumed ELCR exceeded EPA's acceptable range.

As discussed in the OSWER Directive 9355.0-30 dated April 22, 1991, acceptable risk levels, where the cumulative carcinogenic risks to an individual based on reasonable exposure, can range from $10E-4$ to $10E-6$ as long as the cumulative excess lifetime carcinogen site risk is less than $10E-4$ and the noncancer hazard index (HI) is less than 1.0. For each receptor with a site-side cumulative ELCR greater than $10E-4$, Preliminary Cleanup Standards (PCSs) were calculated for each such receptor for each media type for constituents of concern (COCs) that exceeded a ELCR of $10E-6$ or a HI of 0.1. PCS for each COC were calculated for an ELCR of $10E-4$, $10E-5$, and $10E-6$ and a HI of 3, 1, and 0.1. In order to meet the goal of the cumulative ELCR of less than $10E-4$ and a HI of 1.0 across all media, the analytical samples from each sample media were compared to the calculated PCS with the ELCR of $10E-5$ or a HI of 0.1. The value for the most conservative receptor (lowest value) for the $10E-5$ target risk level or HI of 0.1 was selected as the PCS for human health exposure. Groundwater COCs were also compared to the United States Environmental Protection Agency (USEPA) maximum contaminant levels (MCLs).

As part of the CMS, corrective action alternatives were identified, screened, and evaluated in terms of effectiveness, implementability, and cost so the most protective, efficient, and

economical remedial alternative could be identified and selected to remediate media that exceeded the calculated PCSs. The six alternatives evaluated are summarized below:

Alternative 1 No Action

The *No Action* alternative assumes that no further remedial action will occur at the site and has been included to establish a baseline for alternative comparison.

Alternative 2 Physical, Legal, and Administrative Barriers (Land Use Controls)

The *Physical Barrier, Legal Barrier, and Administrative Barrier* (Institutional Control) alternatives consist of administrative and physical mechanisms to place restrictions on the use of and limit access to the site and/or specific SWMUs/AOCs to prevent exposure to site contaminants.

Alternative 3 Land Use Controls + Groundwater Monitoring

The *Land Use Controls and Groundwater Monitoring* alternative consists of a combination of technologies including administrative land use controls and groundwater monitoring. This alternative would meet the corrective measure objectives by monitoring the contaminated site groundwater to ensure the groundwater constituent concentrations are stable and implementing a Land Use Control Plan (LUCP) to protect future receptors in the unlikely event the land use changes.

Alternative 4 Land Use Controls + In-Situ Soil Source Area Treatment + In-Situ Groundwater Treatment + Groundwater Monitoring

The *Land Use Controls, In-Situ Soil Source Area Treatment, In-Situ Groundwater Treatment, and Groundwater Monitoring* alternative consists of a combination of technologies including administrative land use controls, in-situ injection to treat subsurface soil and groundwater, and groundwater monitoring. This alternative would meet the corrective measure objectives by reducing and/or eliminating exposure to the affected site media (see Section 4.3) through injection of bacteria or chemicals to remove contaminants and the development and implementation of a LUCP to protect future receptors in the unlikely event the land use changes. In addition, long term groundwater monitoring would confirm that the treatment is effective.

Alternative 5 Land Use Controls + In-Situ Soil Source Area Treatment + Groundwater Removal and Treatment + Groundwater Monitoring

The *Land Use Controls, In-Situ Soil Source Area Treatment, Groundwater Removal and Treatment, and Groundwater Monitoring* alternative would meet the corrective measure objectives by reducing and/or eliminating exposure to the affected site media (see Section 3.3) through in-situ treatment of soil source areas (with associated ancillary treatment of groundwater) and through removal and

treatment of contaminated groundwater. In addition, a LUCP will be implemented to protect future receptors in the unlikely event the land use changes. In addition, groundwater monitoring would confirm that the chosen treatment alternative is effective.

Based on the conclusions of the detailed analysis that was performed individually and collectively with respect to the five alternatives, one alternative was recommended to address potential contamination of the impacted media. The selected alternative is listed below:

Alternative 5 Land Use Controls + In-Situ Soil Source Area Treatment + Groundwater Removal and Treatment + Groundwater Monitoring

The *Land Use Controls, In-Situ Soil Source Area Treatment, Groundwater Removal and Treatment, and Groundwater Monitoring* alternative would be the most efficient and economical method to meet the Corrective Action Objectives (CAOs) for SMA 4 and provide long-term protection of human health and the environment.

Corrective Measures Study

SMA 4 – Former Chemical Plant (Revision 1.1)

ERP Coke
3500 35th Avenue North
Birmingham, Alabama

Project No. E1137227
April 14, 2017

1.0 INTRODUCTION

The ERP Compliant Coke, LLC (ERP Coke) facility is located at 3500 35th Avenue North in Birmingham, Jefferson County, Alabama (Figure 1-1). This Corrective Measures Study (CMS) for SMA 4 has been prepared in accordance with paragraph 29 of the Order on Consent with effective date of September 24, 2012. A map of the current facility including the 45 Solid Waste Management Units (SWMUs) and six Areas of Concern (AOCs) consolidated into five SWMU Management Areas (SMAs) is included as Figure 1-2.

The roots of the facility can be traced back to 1881 when Sloss-Sheffield Steel and Iron Company first began producing pig iron in Birmingham, Alabama. In 1920, where ERP Coke sits today, Sloss-Sheffield Steel and Iron Company built two modern coke oven batteries to serve its own needs as well as those of other customers. As Birmingham's steel industry grew, so did the need for furnace coke, which prompted the construction of three more batteries at the site during the 1950s.

As American industry evolved in the ensuing years, so did the operation of the facility. Today, ERP Coke is a highly efficient, technologically advanced operation serving a variety of customers in the furnace and foundry markets.

The operation now consists of three batteries with a total of 120 coke ovens which produce approximately 460,000 tons of coke each year. A highly experienced operating staff provides assurance of adherence to strict operating, environmental, and safety standards.

The original coke manufacturing facility began operation in 1920 as Sloss Sheffield Steel and Iron Company. Beginning in 1952, the company experienced a series of corporate reorganizations and several name changes culminating in a name change to Walter Coke, Inc. in June 2009, and then the purchase of the coke plant assets by ERP Compliant, Coke, LLC occurred in February 2016. The following operations have occurred at the facility:

- n The biological treatment facility (BTF), designed to treat wastewater generated at the facility, was constructed in 1973-74, first received wastewater in 1975 and is still in operation today. SMA 1 includes the BTF Process Area.

- n Land Disposal Areas (LDAs) have been used at various times over the life of the facility. Biological sludge, blast furnace sludge, and construction and demolition debris have been placed in the land disposal areas. SMA 2 includes the LDA.
- n Coke manufacturing has occurred since 1920, and 120 coke ovens continue to operate. SMA 3 includes the Coke Manufacturing Plant.
- n Chemical manufacturing began at the facility in 1948, and all chemical manufacturing operations ceased in 2002. In addition, a mineral wool plant, which manufactured mineral fiber used in the production of ceiling tile and insulating products, was built in late 1947 and was decommissioned in 2010. SMA 4 includes the FCP and the mineral wool piles.
- n An iron blast furnace that produced pig iron from iron ore began operation in 1958; blast furnace operations ceased in 1981, and the blast furnace was decommissioned in 1984. SMA 5 includes the Former Pig Iron Foundry (FPIF).

The land around the ERP Coke facility is zoned for industrial and residential use, and a significant number of other industrial facilities remain operational in the area. Before 1957, the area was primarily industrial, with a significant number of other facilities, including coke and cement manufacturing plants, pipe manufacturing plants, and limestone quarry operations. Residential neighborhoods were constructed on properties in the area of ERP Coke only after 1957 (USEPA, 1990). The most likely future land use for the ERP Coke facility is industrial.

1.1 1989 RCRA Order

The following provides a brief chronological overview of key points in the regulatory history associated with the 1989 RCRA Order:

- n August 1989 - EPA completed the RCRA Facility Assessment (RFA).
- n September 29, 1989 - Section 3008(h) Administrative Order 89-39-R was issued requiring performance of an RFI and a CMS.
- n October 24, 1990 – After a challenge to the 1989 Administrative Order, a Modification to the Administrative Order and Settlement Agreement was entered and then governed work at the facility.
- n 1990 to 1994: Planning for the RFI to characterize the nature, extent, and rate of contaminant migration from the identified SWMUs was submitted, and a draft RFI Work Plan was submitted to EPA for review and approval.
- n The RFI Work Plan, which outlined an approach for investigating the 39 SWMUs, was approved by EPA in 1994.

- n 1995 and 1996 – A Facility-Wide Investigation (FWI) was completed to develop a conceptual hydrogeologic and hydrologic model of the facility.
- n 1996 to 1999 – Numerous RFI field investigations were conducted and reports submitted to EPA.
- n 2000 to 2001 – Phase II field investigations were conducted.
- n 2002 – Interim Remedial Measures (IM) Work Plan for the Chemical Plant was submitted to EPA.

In an effort to help EPA complete its environmental indicator (EI) determinations for the site and thereby help EPA meet its Government Performance Results Act (GPRA) goal to show that human exposures and groundwater releases were controlled by September 30, 2005, the following activities that are specific for EI determination were completed:

- n February 2005 – Proposed EI Sampling Plan submitted.
 - o March 2005 – EPA approved the EI Sampling Plan.
- n July 2005 - Consolidated Overview of Environmental Data in Support of the EI Determination submitted.
 - o September 30, 2005 – EPA issued the final EI evaluation of the facility’s status in relation to RCRA Information System (RCRIS) CA Codes 725 and 750. The CA 725 decision was noted as “Yes”; the CA 750 decision was noted as “No”.
 - o March 16, 2012 - EPA issued another EI evaluation of the facility’s status in relation to RCRA Information System (RCRIS) CA Codes 725 and 750. The CA 725 decision was noted as “No”; the CA 750 decision was noted as “No”.

Following the completion of the EI activities, the next phase of RFI activities was the focus.

- n 2006 – EPA issued technical comments on several RFI reports.
- n 2007 – Phase III RFI Work Plan was prepared and approved by EPA.
- n 2009 – Draft Phase III RFI Report submitted.
 - o June 2009 – Addendum to the Phase III report submitted.

1.2 2012 RCRA Order

Pursuant to EPA’s stated desire to update the 1989 Order, Walter Coke and EPA entered a RCRA Section 3008(h) Administrative Order on Consent (AOC) with the effective date of September 24, 2012. The 2012 AOC declared that all of the approved investigation tasks of the RCRA Facility Investigation (RFI) Work Plans required by the 1989 Order had been completed and that the 1989 Order was terminated and no longer in effect. Under the 2012 AOC, there are 5 SMAs consisting of 45 SWMUs and 6 AOCs at the facility (Figure 1-2). In February 2016, ERP Coke purchased certain assets of Walter Coke, Inc., including the coke plant, in a transaction in which ERP Coke agreed to implement the 2012 AOC.

As part of the Order, a CMS is being prepared for each of the 5 SMAs to evaluate the need, if any, for corrective measures. The scheduled completion date for each CMS is:

- n CMS SMA 1 – Previously submitted to EPA on May 24, 2013 (Revision 1.0 submitted to EPA on January 24, 2014)
- n CMS SMA 2 – Previously submitted to EPA on July 22, 2013
- n CMS SMA 3 – Previously submitted to EPA on September 24, 2013
- n CMS SMA 4 – Previously submitted to EPA on March 24, 2014 (Revision 1.0 is this submittal)
- n CMS SMA 5 – September 24, 2014 (Revision 1.0 submitted September 30, 2015 and Revision 1.1 submitted May 20, 2016)

In addition to the CMS, Interim Measures (IMs) are being conducted in the area of SMA 4 to address groundwater impacts largely confined to the site. The IMs consists of hydraulic control and treatment of the groundwater in AOC D [Former Chemical Plant (FCP) Groundwater Plume], groundwater sampling and analysis.

1.3 Corrective Measures Study (CMS) Overview

The CMS is the portion of the RCRA corrective action process designed for the identification and evaluation of potential remedial alternatives for conditions that have been documented at a facility (USEPA, 1994). Once properly evaluated with respect to criteria such as overall protectiveness, effectiveness, and costs, risk managers should have sufficient information to select and initiate the implementation of remedies, if any.

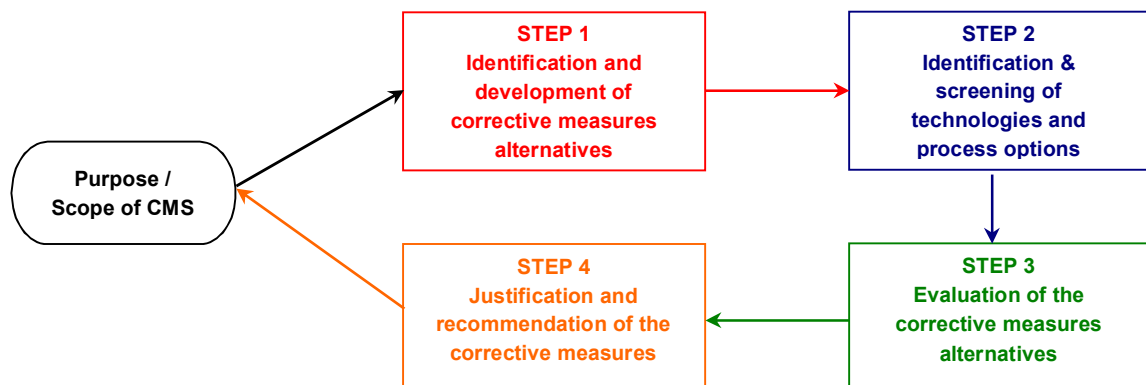

The purpose of this CMS Report is to summarize the evaluation, analysis, and selection of appropriate corrective action at SMA 4. SMA 4 consists of twelve SWMUs and two AOCs (Figure 1-3). They include:

- n SWMU 26 – Main Process Building
- n SWMU 27 – Floor Drain System
- n SWMU 28 – Sulfonation Floor Drain
- n SWMU 29 – Product Tank Containment Area
- n SWMU 30 – Centrifuge Waste Water Tank
- n SWMU 31 – Monohydrate Floor Drain and Sump
- n SWMU 32 – Drum Storage Area
- n SWMU 33 – Plant Drum Storage Area
- n SWMU 34 – Wastewater Neutralization System
- n SWMU 35 – Mineral Wool Piles
- n SWMU 36 – Used Oil Tank
- n SWMU 42 – Former Above Ground Storage Tanks (ASTs)
- n AOC B – Drainage Ditch next to Shuttlesworth Drive and 35th Avenue

n AOC D – Former Chemical Plant (FCP) Groundwater Plume

This CMS has been prepared to identify remedial alternatives identified for SMA 4. As part of the CMS activities, a Risk Assessment Work Plan (Revision 1.1) was submitted to EPA on March 6, 2013. The Risk Assessment Work Plan was approved by EPA on March 15, 2013. In accordance with that Plan, the Risk Assessment prepared as part of this CMS, will consider risk in SMA 4 and clean up goals for various constituents present in SMA 4. The CMS will also identify and compare remedial alternatives for certain affected media present in SMA 4. The data set utilized to conduct the Risk Assessment was a comprehensive Microsoft Access database provided to Terracon by CH2MHILL. It is our understanding that this database was inclusive of the data collected at the site during all investigations previously conducted at the facility. The Risk Assessment being performed during the CMS process derives and calculates assumed potential risks to human health and the environment based on highly protective assumptions that are unlikely to occur in reality. Carcinogenic risks in excess of 1E-06 and/or noncarcinogenic hazard indexes in excess of 1.0, were used to delineate areas and volumes of affected media, and corrective action alternatives were developed and evaluated as possible site cleanup remedies. This CMS focuses primarily on addressing the potential risks posed to site receptors from exposure to contaminants at SMA 4.

Four fundamental phases or steps, as shown in the diagram below, are inherent to the development of any CMS. Once these steps are defined, a wide range of options exist for structuring and refining a CMS to meet the specific goals, objectives, and regulatory requirements associated with a given project site. Based on the RCRA Corrective Action Plan, OSWER Directive 9902.3-2A (May 1994), Chapter IV – Corrective Measures Study, this CMS Report was prepared according to the following steps:

**1.4 Site Description**

The ERP Coke facility is located at 3500 35th Avenue North in Birmingham, Jefferson County, Alabama, as shown on Figure 1-1. This active, coke production facility encompasses an area of

approximately 460 acres. SMA 4 is located on the southeastern end of the facility, as shown on Figure 1-2.

SMA 4 comprises the FCP. SWMU 26 – Main Process Building was the main process building of the FCP. SWMU 27 – Floor Drain System, SWMU 28 – Sulfonation Floor Drain, and SWMU 31 – Monohydrate Floor Drain and Sump are floor drains and sumps in the processing portion of the FCP. SWMU 29 Product Tank Containment Area, SWMU 30 – Centrifuge Waste Water Tank, and SWMU 42 – Former Aboveground Storage Tanks (ASTs) are process tanks that were located in the immediate vicinity of the FCP. SWMU 32 – Drum Storage Area and SWMU 33 – Plant Drum Storage Area was an area that was used to store drums of chemicals used in the processes conducted at the FCP and the Coke Plant. SWMU 34 – Wastewater Neutralization System was used to neutralize the pH prior to the waste water entering the biological treatment process. SWMU 35 – Mineral Wool Piles are piles of Mineral Wool that originated in the Mineral Wool Plant that was previously located on the site. The mineral wool was placed onto large piles, and is being marketed for beneficial re-use. SWMU 36 – Used Oil Tank is an area located north of the FCP building which formerly contained a used oil tank. AOC B – Drainage Ditch next to Shuttlesworth Drive and 35th Avenue is the drainage ditch that runs along the southern boundary of the ERP Coke Facility between the facility boundary and Shuttlesworth Drive/35th Avenue. AOC D – FCP Groundwater Plume is the groundwater plume of VOCs identified in the FCP area during previous investigations. Interim Measures (IM) has been implemented for AOC D. The IM includes hydraulic control and treatment of the groundwater plume. Additionally, a Vapor Intrusion Study in the offsite area immediately to the east of the FCP has been completed, and the results demonstrated and EPA agreed that no further action was needed.

The FCP primary product lines were foundry catalyst used in sand cast foundry molds to make iron pipe and other foundry Products. The foundry catalysts consisted of sulfonic acid products. These products were benzenesulfonic acid (BSA), toluenesulfonic acid (TSA), xylensulfonic acid (XSA), chlorobenzenesulfonic acid (CLBSA), and phenolsufonic acid (PSA). The raw materials used in the production were benzene, toluene, xylenes, chlorobenzene and phenol. These raw materials were reacted with sulfuric acid in glass lined reactors to produce the end products. In addition, para-toluenesulfonic acid (PTSA) was imported and sold along with this product line. Some specialty chemicals were also produced in the old chemical plant. Listed below are the products and associated raw materials:

PRODUCT

Benzenesulfonyl Chloride
Cholestatrienol

Dow Corning Products for Green Tires
2,6-naphthalene dicarboxylate (NDC)

RAW MATERIALS

BSA and Chlorosulfonic acid
Extracted from yeast culture using Ethyl alcohol and Ethyl acetate
Sulfido-silanes
additive for plastic food containers, made from 2,6-naphthalene dicarboxylic acid (NDA) and methyl alcohol.

PROCESSING AIDS

Sodium Hydroxide, Hydrochloric Acid, Calcium Hydroxide, Magnesium Hydroxide, Hydrogen Peroxide

1.5 Environmental Setting

1.5.1 Surface Water Bodies

There are no surface water bodies located in the vicinity of SMA 4. AOC B – Drainage Ditch next to Shuttlesworth Drive/35th Avenue is located outside of the plant fence and is considered part of SMA 4. This ditch runs east-northeast along 35th Avenue from the southernmost end of the property to the corner of Shuttlesworth Drive. The ditch then runs northeast along Shuttlesworth Drive to the eastern edge of the property. The ditch is located inside the property boundary.

1.5.2 Bedrock Geology

The facility is underlain by sedimentary rocks that range in age from Cambrian to Pennsylvanian. The Opossum Valley Fault generally trends northeast to southwest, crossing through the ERP Coke property in the northern portion of the facility at SWMU 22. The majority of the ERP Coke property lies on the hanging wall fault block to the east of the Opossum Valley Fault. The foot wall of the fault lies to the west and underlies Sand Mountain. The majority of the ERP Coke property is underlain by the Conasauga Formation. The Red Mountain Formation, Fort Payne Formation, Tusculum Limestone, Hartselle Sandstone, Floyd Shale, and Pottsville Formation outcrop in the small area of the facility on the western side of the fault on the north side of the facility. A Geologic Map is included as Figure 1-4. Cross Sections provided in the CH2MHILL Phase III RFI are included as Figures 1-5 through 1-7.

The Conasauga Formation is Cambrian Age and typically is medium gray, thin- to medium-bedded limestone. Locally, bedding thickness is reported to range from a few inches to as much as 5 feet or more in the massive sections. Massive bedding sections are rare and bedding thicknesses less than 1 foot are common. Locally, the Conasauga Formation dips to the southeast

at 26 to 32 degrees, with a strike of approximately N45°E. An extensive network of faults and joints has developed in the Conasauga Limestone because of thrust faulting. The faults and joints typically trend northeast and northwest. The northeast trending joints (strike of N45°E) dip approximately 60°NW (approximately perpendicular to bedding), while the northwest trending joints strike N300W and have subvertical dips. The results of previous investigations indicate that the upper 2 feet of the Conasauga Formation underlying the ERP Coke facility are highly weathered. Below the weathered surface, the limestone is generally massive, with few fractures. The limestone is typically hard, with 1- to 2-foot-thick lenses of softer, darker gray shale and shaley limestone. Occasionally, fractures are present, ranging from a few inches to a few feet thick. Fracture zones typically contain limestone rubble that exhibits secondary healing by calcite crystals. Fracture zones typically are encountered in the upper 50 feet of the formation and are less frequent with increasing depth.

On the western side of the Opossum Valley Fault (in the SWMU 22 area), outcrops of the Hartselle Sandstone, Tuscumbia Limestone, Fort Payne Chert, Red Mountain Formation, and Pottsville Formation have been mapped. Brief descriptions of these units are provided below:

- Hartselle Sandstone – composed mainly of clean, well-sorted, light-colored, very fine- to medium-grained quartz sand;
- Tuscumbia Limestone – consists of thick-bedded, medium-dark to medium-gray, crystalline, oolitic, sublithographic, and bioclastic limestone with minor amounts of chert;
- Fort Payne Chert – consists of dark-gray sublithographic limestone and dense dark-gray chert;
- Red Mountain Formation – consists of dark-reddish-brown to olive-gray siltstone, sandstone, and shale with hematite beds;
- Pottsville Formation – characterized by alternating beds of sandstone and shale with numerous coal seams and associated underclays.

The topography of the bedrock underlying the ERP Coke facility generally slopes to the north toward Five Mile Creek (FMC). Top-of-bedrock elevations range from 583.1 feet above mean sea level (amsl) in the Coke Plant area to 498.6 feet amsl near FMC. Weathering of the Conasauga Formation has produced undulations in the surface of the bedrock. Several feet of relief have developed on the bedrock surface. This relief is as much as several tens of feet in some areas of the property; however, karst features are not evident at the ground surface. Where exposed, enlargement of bedding planes and fractures appears to have occurred through solution of the bedrock. Solutionally enlarged fractures and joints primarily are limited to the upper few feet of bedrock and have been observed up to 1 foot wide.

1.5.3 Soils

The majority of the overburden at the ERP Coke facility consists of residual soil from weathered Conasauga Formation (residuum). On and adjacent to Sand Mountain (immediately west and

north of SWMU #22), residual soils have formed on the Hartselle Sandstone and the Tusculumbia Limestone. Near the Coke Plant and the FCP, industrial fill material is present at thicknesses ranging from 0.5 to 6 feet. Similar fill material is present in the BTF area. The overburden ranges in thickness from 2 to more than 20 feet. Native soil over limestone consists of cohesive, medium-stiff to stiff inorganic clays of low to medium plasticity and high plasticity. General engineering properties, as indicated by analytical and visual observations of site soil properties, include high shrink-swell potential, low permeability, and low-strength capabilities.

Near the base of the residuum at the bedrock interface, a zone of more permeable soils has developed, with chert and highly weathered limestone gravels consolidated from the weathering of the underlying bedrock. This area typically is referred to as the rubble zone. Where observed, the rubble zone appears to range up to 2 feet thick. The rubble zone does not appear to be laterally continuous throughout the facility, but may be a significant water bearing zone locally.

1.5.4 Hydrogeology

The conceptual hydrogeologic flow model for the site is composed of residuum groundwater, shallow bedrock groundwater, and deep bedrock groundwater. Groundwater occurs within the residuum where the water table is higher than the bedrock surface. Groundwater flow through this material occurs in interstitial pore spaces between the clay particles at a low rate due to the relatively low permeability. Flow rates may be higher where a concentration of chert gravels at the bedrock surface has occurred. Within the shallow and deep bedrock aquifers, groundwater migrates along fractures and bedding planes both horizontally and vertically. Within the shallow bedrock aquifer, groundwater flow is primarily horizontal due to the interconnectivity of the fractures. Groundwater within the shallow bedrock discharges to surface water bodies such as the Lafarge Quarry, surface drainage ditches, and FMC. Deep bedrock groundwater is anticipated to migrate toward discharge points such as the Lafarge Quarry.

Based on information provided in the Phase III RFI prepared by CH2MHILL, the groundwater monitoring well network at the Coke facility consists of 109 monitoring wells and piezometers. Monitoring wells and piezometers are constructed of 2-inch diameter, Schedule 40 polyvinyl chloride (PVC) casing and screens with a sand pack. Screens are typically 10 feet long with a 0.010-inch slot size. The sand pack typically extends a minimum of 2 feet above the top of the screen, above which a 2-foot bentonite well seal is installed. Neat cement grout, which typically is installed following hydration of the bentonite seal, extends upward to the ground surface. A surface isolation casing, usually 10-inch-diameter steel, typically is installed from the top of bedrock to the ground surface for bedrock monitoring wells at locations where residuum groundwater is encountered.

Monitoring wells can be grouped into four classifications based on the various units they monitor, as described in the following text:

- n Residuum monitoring wells are those wells with screens that are completed within the unconsolidated residuum above bedrock or those monitoring wells with screens and sand filter packs that extend above the top of the bedrock (mixed monitoring). Eleven wells have been classified as residuum (or mixed) monitoring wells. Most of these wells are located in the BTF area, primarily surrounding SWMU 13.
- n Shallow bedrock monitoring wells have screens completed entirely within the Conasauga Formation, with 10-foot screens generally between 0 and 40 feet below the top of the bedrock surface. These wells are situated in the fractured and weathered upper portions of the Conasauga Formation. There are 78 shallow bedrock monitoring wells.
- n Deep bedrock monitoring wells have 10-foot screens completed between 40 and 300 feet below the top of the bedrock surface. These wells are situated in the less fractured and weathered lower portions of the Conasauga Formation, where groundwater flow is significantly slower than that observed in the shallow bedrock aquifer. There are 16 deep bedrock monitoring wells.
- n Four monitoring wells have been completed in formations other than the Conasauga Limestone. These non-Conasauga monitoring wells have been installed at SWMU 23 in SMA 4, on the western side of the Opossum Valley Fault. They are not completed in the Conasauga Formation and their groundwater elevations are not included in the potentiometric surface maps developed for either the shallow or deep Conasauga Limestone flow zones in the Phase III RFI. These wells have been constructed with 10-foot screens, with total depths ranging from 63 feet to 118.5 feet below ground surface (bgs).

Three potential water-bearing zones are composed of 1) residuum soils and the upper weathered bedrock surface; 2) shallow bedrock (20 to 140 feet bgs); and 3) deep bedrock (140 feet bgs). Water enters the groundwater system in the valley via infiltration of rainfall through the residual soils and lateral migration of groundwater through the residuum and shallow bedrock aquifer. Recharge moves vertically downward until it encounters the rubble zone, where lateral groundwater flow across the bedrock surface may occur. Because of the discontinuous occurrence of groundwater in the residuum (based on observations during the site wide drilling efforts) and the relative lack of site wide residuum monitoring wells, a potentiometric surface map for residuum groundwater has not been developed.

Groundwater flows from the residuum into the shallow bedrock aquifer through fractures and joints in the Conasauga Formation. Within this formation, groundwater flow is controlled by the occurrence and relationships among fractures, joints, and bedding planes of the limestone and shale. These features are interconnected and comprise the dominant feature of the groundwater flow systems, providing flow paths for groundwater migration. Significant water-bearing zones in the Conasauga Formation vary laterally and with depth. The upper weathered bedrock surface,

fractures, and soft, shaley zones in the upper 20 feet to 140 feet appear to be hydraulically connected, based on historical water level data.

Although recovery rates are slow for wells completed in the deep Conasauga Formation, water level measurements indicate that the deep zone generally is in hydraulic connection with the more permeable shallow zones of the Conasauga Formation.

Potentiometric surface maps of the shallow and deep bedrock flow zones were developed for the facility during the Phase III RFI using water level measurements collected site wide on April 28 and 29, 2008 by CH2MHILL (Figures 1-8 and 1-9). Groundwater gradients depicted in the shallow bedrock potentiometric surface map, Figure 1-8, indicate that shallow bedrock groundwater generally flows from southwest to northeast toward FMC with local influence from Lafarge Quarry operations. The Lafarge Quarry is anticipated to serve as a discharge point for shallow bedrock groundwater.

Locally, a hydraulic ridge has developed in the shallow bedrock potentiometric surface, trending generally southeast to northwest and extending from P-19S beneath the Coke Plant toward the former Chemical Plant and MW-55 (a local groundwater high). Near the former Plant, groundwater flows radially away from MW-55. Groundwater appears to flow from the former Chemical Plant offsite to the east. Along the southern boundary of the ERP Coke facility, shallow bedrock groundwater appears to flow to the southeast. Groundwater elevations in the residuum in the BTF area are as much as 10 feet higher than those recorded in the shallow bedrock aquifer, indicating recharge of the shallow bedrock aquifer by residuum groundwater.

The inferred groundwater flow direction (based on groundwater gradients) in the deep bedrock aquifer is generally eastward across the facility (Figure 1-9). At the northern end of the facility near the BTF, there may be deviations in the flow direction to the northeast, whereas at the southern end of the facility near the Coke Plant, there may be deviations to the southeast. A steep gradient is noted around the Lafarge Quarry, which exerts a local effect on the potentiometric surface through groundwater extraction. Deep bedrock groundwater likely discharges to the Lafarge Quarry to the east. The pumping of water from the quarries has created hydraulic sinks in the deep bedrock aquifer, causing deep bedrock groundwater to flow to the east.

Figure 1-10 through Figure 1-12 show the November 2014, February 2015, and June 2015 potentiometric surface maps for SMA 4. The groundwater flow in SMA 4 is generally towards the east as presented in the figures.

1.5.5 Ecological Setting

ERP Coke is a large, active, industrialized facility. Generally, the southern three fourths of the property is occupied by buildings and structures associated with the coke manufacturing process, the FCP, as well as raw materials (coal), roads, railways, and active large vehicles (rail cars). The

only area on the facility where industrial activity is less extensive is at the northern end, which is occupied by the active BTF and various land disposal areas that have been relatively undisturbed in recent years. Terrestrial and aquatic habitats in this area are supportive, to varying degrees, of populations of terrestrial and aquatic plants and animals. FMC, which is immediately north of the facility boundary, receives treated wastewater discharge via ERP Coke's NPDES-permitted outfall. FMC has a U.S. Fish and Wildlife Service (USFWS) designated water use.

1.5.5.1 Terrestrial Habitats

Terrestrial habitats are present at this facility and support a variety of plants, as well as various invertebrates, birds, and mammals. The terrestrial habitats are dominated by grasses, scrub-shrub, vines, saplings, and deciduous trees. Wildlife noted on the site includes several bird species (hawks, vultures, sparrows, and songbirds), small mammals (rabbits, foxes, and beavers), and frogs. SWMUs that have terrestrial habitat include SWMUs 23, 24, 25, 38, 39, 40, and 41. The BTF, located at the northern end of the facility, is characterized by a wooded area surrounding SWMUs 23, 40, and 41, the open scrub-shrub area of SWMU 24, and maintained grasses throughout the developed process areas. Surrounding SWMU 25 from the western edge of SWMU 38 to the property boundary to the west, the property is characterized as a riparian zone. SWMUs 38 and 39 are characterized as disturbed land containing low-diversity vegetation. The southern areas of the property, which are highly industrialized, contain no terrestrial habitat supportive of plant or wildlife communities. None of the SWMUs described above are located within the boundaries of SMA 4.

1.5.5.2 Aquatic Habitats

Aquatic habitats are present at SWMUs 13, 22, and 25, as well as at FMC, and support a variety of plants, invertebrates, fish, birds, and small mammals. Wetland areas have developed in storm water collection areas such as the southern end of SWMU 22. The SWMU 40 and SWMU 22 discharge into FMC via an outfall area at the northern end of the BTF. Evidence of aquatic flora and fauna, including cattails, willows, soft rushes, water oaks, frogs, small- and large-bodied fish species, and macroinvertebrates, can be found in the aquatic habitats onsite and in adjacent FMC. None of the SWMUs described above are located within the boundaries of SMA 4.

1.6 Evaluation of Previous Data from the SWMUs and AOCs in SMA 4

Other than in AOC B, surface soil (0-1 foot) samples were not collected in SMA 4 because the areas not containing structures were covered by concrete or asphalt surfaces. Based on a review of the previous reports submitted for the site, subsurface samples were collected from the areas where there was the potential for a release to the soil. Nineteen groundwater wells were placed in and around SMA 4. The spacing of the wells is such that if a release occurred in SMA 4, it should be detected by the monitoring well network.

1.6.1 Main FCP Area

The main portion of the FCP consists of SWMUs 26, 27, 28, 29, 30, 31, 32, 33, 34, 36, 42, and AOC D. A description of the processes in the FCP is included in Section 1.4. Soil samples were collected from a total of 74 locations designated CM-SB0001 through CM-SB0013, CM-SB0015 through CM-SB0063, 26-SB0001, 26-SB0002, 27-SB0001, 27-SB0002, 29-SB0001, 29-SB0002, 31-SB0001, 31-SB0002, MW-52, MW-53, MW-54, and MW-55 during the previously conducted RFIs. There are a total of eighteen monitoring wells located in and around SMA 4 designated MW-49S, MW-49D, MW-50 through MW-56, MW-70 through MW-72, MW-77, MW-78, MW-80, MW-81, MW-89, and MW-90. These wells have been sampled three times from April 2013 through November 2013.

IM is also being conducted in the area east of the main FCP area. The IM includes hydraulic control via pump and treat methods of AOC D and a VI Study in the area offsite to the east of the main FCP area has been completed.

1.6.2 SWMU 35 – Mineral Wool Piles

The Mineral Wool Piles are SWMU 35. The mineral wool piles are pieces and shots of mineral wool resulting from the manufacturing process. The mineral wool is a salable product that ERP Coke markets. Due to site knowledge of the manufacturing process and raw materials, the mineral wool chemical composition is relatively uniform. On May 17, 2012, the USEPA collected eight samples from various portions of SWMU 35. ERP Coke collected splits of the samples the USEPA collected.

1.6.3 AOC B – Drainage Ditch next to Shuttlesworth Drive and 35th Avenue

AOC B is a drainage ditch that runs along the north side of 35th Avenue and FL Shuttlesworth drive inside of the facility property boundary. Soil/sediment samples were collected from this ditch are part of preparing this CMS. The sampling program and results from AOC B are presented in Section 2.0.

2.0 SOIL SAMPLING PROGRAM AOC B

Soil sampling was not previously conducted in AOC B; therefore, a soil sampling program was conducted to obtain representative surface soil (0-1 foot depth interval) samples in AOC B.

2.1 Soil Sample Collection

On December 8, 2015, Terracon collected ten surface soil samples (designated SBB001 through SBB010) in AOC B using stainless steel trowels and spoons. The soil boring locations are shown on Figure 2-1. Boring logs are included as Appendix C.

Prior to initiation of sampling activities and between samples, the trowels and spoons were decontaminated in accordance with the approved QAPP. An equipment blank was collected to provide quality assurance that the sampling equipment was adequately cleaned. Field blanks and trip blanks were submitted to the laboratory for analysis with the soil samples to provide quality assurance that external contaminants were not introduced into the samples during collection or transport.

This sampling was conducted by a Terracon geologist, Mr. Eric Reardon. Surficial samples were collected from the 0-1 foot depth interval. A representative portion of the sample interval was collected into labeled, laboratory-provided, glass jars with Teflon-lined lids for submission to the analytical laboratory.

The soil samples were submitted under chain-of-custody to TestAmerica in Arvada, Colorado, for analysis of volatile organic compounds (VOCs) per USEPA Method 8260B, semi-volatile organic compounds (SVOCs) per USEPA Method 8270D, and polynuclear aromatic hydrocarbons (PAHs) per EPA Method 8270CSIM.

The soil samples collected on December 8, 2015, did not get analyzed by the laboratory for PAHs by EPA Method 8270 and were out of holding time when this error was noticed. Therefore, Terracon collected additional surficial soil samples on January 19, 2016 from locations immediately adjacent to the initial sample locations and submitted them to TestAmerica for analysis of PAHs by EPA Method 8270SIM.

2.2 Data Review and Validation

The laboratory conducted an initial data review and validation according to the laboratory QA manual. Data validation included application of data qualifiers to the analytical results based on adherence to method protocols and QA/QC limits. A discussion of applied data qualifiers is included within the case narrative of the analytical report for each sample delivery group. Data meeting *analytical* validity requirements set by the analytical method and the fixed-laboratory were further reviewed against the project-specific DQOs. This data validation was performed by a

qualified Terracon professional outside of the project implementation chain-of-command, in accordance with the Terracon Corporate Quality Program Manual and this project's DQOs.

Items reviewed included the following components:

- Completeness Check;
- Chain of Custody (signatures, sample conditions, preservatives, sampling handling/filtering);
- Holding Times;
- Random check (10-20%) of Initial and Continuing Calibration;
- Review of Quality Control Summaries including negative control (blanks) and positive control (LCS);
- Review of Sample Specific Controls (replicates, matrix spikes, surrogates, tracers/ yields);
- Overall PARCC assessment.

Data quality assessment (DQA) criteria were used to evaluate the quality of the field sampling efforts and laboratory results for compliance with project DQOs. The DQA criteria are expressed in terms of analytical precision, accuracy, representativeness, completeness, and comparability (PARCC).

Precision: is a measure of the reproducibility of analyses under a given set of conditions compared to the criteria of the individual laboratory's Quality Assurance Manual.

Matrix precision is calculated using equation (1).

$$RPD = \frac{|D_1 - D_2|}{(D_1 + D_2)/2} \cdot 100, \quad (1)$$

where,

RPD = Relative Percentage Difference

D1 = First sample value

D2 = Second sample value (duplicate)

An RPD within the method-specific control limit indicates satisfactory precision in a measurement system. For these sampling events, duplicate results were predominantly in control.

Accuracy: is a measure of the bias that exists in a measurement system compared to the criteria of the individual laboratory's Quality Assurance Manual.

For accuracy analysis; the percent recovery is calculated using equations (2) and (3).

$$LCS = \frac{\text{Amount of Spike Analyte Detected}}{\text{Known Amount of Spike Analyte Added}} \cdot 100, \quad (2)$$

LCS = Laboratory Control Sample

$$MS \text{ (or MSD)} = \frac{\text{Total Amount of Analyte Detected} - \text{Amount of Analyte Detected in Sample}}{\text{Known Amount of Spike Analyte Added}} \cdot 100 \quad (3)$$

MS (or MSD) = Matrix Spike (or Matrix Spike Duplicate)

Accuracy results for methods and matrices are predominantly in control. For those results in which MS/MSD were out of control; accuracy and precision were generally demonstrated by acceptable LCS/LCSD analysis. Therefore, overall accuracy for these sampling events was acceptable.

Representativeness: Sample data are believed to accurately depict selected site conditions prevailing at the time of sample collection based on a general conformance to established protocols as established by TSOPs, laboratory QA/QC protocol, and/or USEPA/ADEM standard operating procedures.

Comparability: Samples were reported in industry-standard units. Water reporting units were micrograms per liter (µg/L) or milligrams per liter (mg/L). Analytical protocols for the methods were adhered to (with the exceptions noted in the reports) and analytical results are considered comparable.

Completeness: the measure of the amount of valid data obtained from a measurement system compared to the amount that was expected to be obtained under “normal” conditions. This goal will be accomplished if 95% of design samples are taken and found to be qualified for precision and accuracy. Completeness objectives were met, understanding that results qualified with U, UJ or J are usable to meet the project objectives of these sampling events.

The soil data are of acceptable quality and are considered usable to support the project objectives for this sampling event when used in accordance with the validation qualifiers. The laboratory data will be submitted electronically to EPA Region 4 per the steps found on <http://www.epa.gov/region4/superfund/allresource/edd/edd.html>.

2.3 Soil Boring Sample Analytical Results

Summaries of the soil sample analytical results are presented on Tables 1 and 2 in Appendix A. The soil sample analytical results were compared to the EPA Regional Screening Levels (RSLs, November 2015) for Industrial Soil with a target cancer risk of 1×10^{-6} and an HI of 1.0.. The soil sample results were used in portions of the site-specific baseline human health risk assessment (HHRA) found below in Section 3.0. The results of the soil sample analytical data are as follows:

2.4 VOC Analysis

No VOCS were detected above the laboratory reporting limits in any of the soil samples analyzed, and none of the reporting limits exceeded the RSLs.

2.5 SVOC Analysis

The following SVOCs were detected in at least one sample at concentrations exceeding the RSL from the listed surficial soil samples:

- Benzo(a)anthracene – SBB002
- Benzo(a)pyrene – SBB001, SBB002, SBB005, SBB006, SBB008, SBB010
- Benzo(b)fluoranthene – SBB001, SBB002
- Dibenz(a,h)anthracene – SBB001, SBB002
- Ideno(1,2,3-cd)pyrene – SBB001, SBB002

2.6 PAH SIM Analysis

The following PAH SIM were detected in at least one sample at concentrations exceeding the RSL from the listed surficial soil samples:

- Benzo(a)anthracene – SBB002
- Benzo(a)pyrene – SBB001, SBB002, SBB006, SBB009
- Benzo(b)fluoranthene – SBB001, SBB002
- Dibenz(a,h)anthracene – SBB001, SBB002, SBB006
- Ideno(1,2,3-cd)pyrene – SBB002

2.7 RCRA Metals Analysis

The following RCRA metals were detected in at least one sample at concentrations exceeding the RSL from the listed surficial soil samples:

- Arsenic – SBB001, SBB002, SBB3003, SBB004, SBB005, SBB006, SBB007, SBB008, SBB009, SBB010

2.8 Groundwater Leachability

Site Specific Soil Screening Levels (SSLs) for leaching to groundwater were presented in Appendix G of the Phase III RFI prepared by CH2MHILL. The basis of the approach is that infiltrating precipitation has the potential to leach chemicals from the soil to the uppermost groundwater. The leachate is then diluted by the lateral flow within the groundwater-bearing unit. The approach assumes that a hypothetical future groundwater user is present on the immediate

downgradient boundary of the site. Potable groundwater use is assumed for the hypothetical future scenario.

SSLs are inherently conservative estimates that are based on a number of assumptions including:

- The SSL evaluation assumes that there is uniform distribution of COCs across an entire “site” and that groundwater is or could be used on the immediate downgradient edge of the site.
- No degradation of the chemicals is included as the chemicals are transported vertically through the vadose zone or lateral transport in the groundwater bearing unit.
- The leaching of chemicals from soil are dependent on chemical and site specific physical conditions. Leachate concentrations can either be over or underestimated.
- The initial screening of chemicals assumes an infinite source mass and therefore may violate mass limit constraints. Additional evaluation may be required to quantify the chemical mass in the source area or areas to understand mass limit constraints.

The 95% UCL for SMA 4 subsurface soil concentrations were screened against the groundwater protection soil screening levels (GWP SSLs). The GWP SSLs are used to evaluate chemical concentrations in subsurface soil as a means of determining if measured site soil concentrations present a potential threat for future contamination of groundwater. GWP SSLs used for screening of SMA 4 subsurface soil chemical concentrations were derived in the Phase III RCRA Facility Investigation Report (Arcadis & CH2MHill, 2009). If SSLs were not available in the Phase II report, SSLs provided on USEPA’s RSL table (Nov. 2015) were used. The results of the screening are discussed in Section 4.2.2.

3.0 BASELINE RISK ASSESSMENT SMA 4

The purpose of this Baseline Risk Assessment is to calculate theoretically potential adverse health and ecological effects (current or future) caused by hazardous substance releases from a site in the absence of any actions to control or mitigate these releases (i.e., under an assumption of no action) at SMA 4 based on highly protective assumptions that are very unlikely to represent reality. The baseline risk assessment contributes to the site characterization and subsequent development, evaluation, and selection of appropriate response alternatives. The results of the baseline risk assessment are used to help determine whether additional response action may be warranted at the site, to modify preliminary remediation goals, to help support selection of the "no-action" remedial alternative, where appropriate, and to document the magnitude of risk at a site, and the primary causes of that risk (USEPA, 1989). Sections 3.1 through 3.8 comprise the Baseline Human Health Risk Assessment (HHRA). The tables for Section 3.0 are located under the Tables tab at the back of this report.

3.1 Overview of the Human Health Risk Assessment (HHRA)

The purpose of this Baseline Human Health Risk Assessment (HHRA) is to evaluate the theoretically potential adverse effects to humans that may result from exposure to chemicals in the environment at SMA 4 based on highly protective assumptions that are very unlikely to represent reality. The overall risk assessment approach for the HHRA follows the US Environmental Protection Agency's (USEPA's) standard, four-step human health risk assessment paradigm, including: Hazard Identification, Exposure Assessment, Toxicity Assessment, and Risk Characterization. These steps are performed according to methodology and procedures published by USEPA in various guidance documents and databases, including (but not limited to):

- n USEPA's *Risk Assessment Guidance for Superfund (RAGS), Volume I, Human Health Evaluation Manual (Part A)*. (1989)
- n USEPA Region 4's *Human Health Risk Assessment Supplemental Guidance* (2014)
- n USEPA's *RAGS Part E, Supplemental Guidance for Dermal Risk Assessment* (2004)
- n USEPA's *RAGS Part F, Supplemental Guidance for Inhalation Risk Assessment* (2009)
- n USEPA's *RAGS Part B, Development of Risk-Based Preliminary Remediation Goals* (1991)
- n USEPA's OSWER Memo, *Human Health Evaluation Manual, Supplemental Guidance: Update of Standard Default Exposure Factors* (2014)
- n USEPA's *Supplemental Guidance for Developing Soil Screening Levels for Superfund Sites* (2002a)
- n USEPA's *Regional Screening Levels (RSLs)* (November 2015)
- n USEPA's on-line toxicity database, *Integrated Risk Information System (IRIS)*
- n USEPA's OSWER Draft *Guidance for Evaluating the Vapor Intrusion to Indoor Air Pathway from Groundwater and Soils* (2002b)

- n USEPA's *Supplemental Guidance for Assessing Susceptibility from Early-Life Exposures to Carcinogens* (2005)

Specific subtasks performed for this HHRA include:

- n Data Collection, Evaluation, and Selection of Chemicals of Potential Concern
- n Exposure Assessment
- n Toxicity Assessment
- n Risk Characterization
- n Uncertainty Analysis
- n Derivation of Remedial Goal Objectives

Descriptions presented below summarize procedures and methodologies utilized to accomplish each of the subtasks of the bullet list above.

3.2 Data Collection, Evaluation, and Selection of Chemicals of Potential Concern

Surface soil data was collected as described in Section 2.0, above. Subsurface soil data collected during previously submitted investigations were validated prior to this submittal and are used in this HHRA. Data used to evaluate the mineral wool piles were collected on May 17, 2012 by the USEPA. Data used to evaluate risks from exposure to groundwater beneath SMA 4 has been more recently collected, during the last six sampling events from February 2014 through February 2016. Analytical results are presented in Appendix A and the sampling locations for samples are shown on Figure 2-1 and Figures 3-1 through 3-3.

As discussed above, surface soil sample collection was not possible in SWMU 26, SWMU 27, SWMU 28, SWMU 29, SWMU 30, SWMU 31, SWMU 32, SWMU 33, SWMU 34, SWMU 36, and SWMU 42 because the area was either buildings or paved areas. Thus, soil analytical data in these SWMUs are subsurface soil collected at depths down to 15 ft. Surficial soil samples were collected in AOC B from the 0 to 1-foot depth interval.

Chemical data are summarized and tabulated to show pertinent sample statistics for each medium, including: the minimum and maximum concentrations; the appropriate upper confidence limit (UCL) about the mean; and frequency of detection. The USEPA software ProUCL version 5.0.0 (USEPA, 2013) was utilized to determine the chemical data distributions to provide the most appropriate UCLs. Censored data (reported at concentrations below detection limits) were retained and evaluated as described in ProUCL.

Chemicals of potential concern (COPCs) are chemicals retained for quantitative evaluation in the risk assessment as they may present health threats to receptors. COPCs were selected using the screening criteria as described in RAGS Part A (USEPA, 1989) for all chemicals detected at

least once. For selection of soil COPCs, USEPA industrial exposure Regional Screening Levels (RSLs) (USEPA, Nov. 2015a) were used to screen for COPCs by comparing the maximum detected chemical concentrations to the more conservative of the cancer effects RSL, at the 1E-06 level, or the noncancer effects RSL, at the 0.1 level, whichever was less. This ensures that a conservative approach to COPC selection has been performed. COPCs selected for SMA 4 surface soil are presented in Table 3-1 and COPCs selected for subsurface soil are presented in Table 3-2.

An additional screening was performed, aside from that used for COPC selection for the risk assessment. Groundwater protection soil screening levels (SSLs) were used to evaluate chemical concentrations in subsurface soil as a means of determining if measured site soil concentrations may potentially leach to groundwater. SSLs used for screening of SMA 4 subsurface soil chemical concentrations were derived in the Phase III RCRA Facility Investigation Report (Arcadis & CH2MHill, 2009). If SSLs were not available in the Phase II report, SSLs provided on USEPA's RSL table (Nov. 2015a) were used. Chemical screening against groundwater protection SSLs is shown on Table 3-2. Multiple chemicals have a maximum detected concentration that exceeds its SSL.

To further refine the list of chemicals exceeding their SSLs, a statistical analysis was performed to determine the 95% upper confidence limit (UCL) value, which represents a conservative upper bound on the arithmetic mean for the data. To calculate the 95% UCL, USEPA's software, ProUCL v. 5.0 (2013), was used; the resulting ProUCL output is found in Appendix B. The appropriateness of using the 95% UCL to better represent environmental data is discussed further below in Section 3.3.2. Table 3-3 presents a second comparison using the 95% UCL compared to the SSLs for just those chemicals that demonstrated an exceedance. By doing this comparison, the number of chemicals is reduced, as indicated on Table 3-3

It is also evident from reviewing Table 3-3, that multiple chemicals were detected at a very low frequency. For example, 1,1,2-trichloroethane, 1,2-dichloropropane, and chloroform are only detected once out of 177 samples. It is appropriate in this instance, to follow USEPA guidance and eliminate chemicals that are infrequently detected, using the cutoff of 5% detections (USEPA, 1989). The chemicals shown in exceedance on Table 3-3 can be further refined to just those that are detected at a rate greater than 5%, resulting in the following list of chemicals potentially available for leaching from soil to groundwater.

- Benzene
- Chlorobenzene
- Methylene chloride
- Toluene
- Vinyl chloride
- 1-Methylnaphthalene
- 3 & 4 Methylphenol

- 4-Methylphenol (p-cresol)
- Benzo(a)anthracene
- Benzo(b)fluoranthene
- Carbazole
- Dibenzofuran
- Naphthalene
- Arsenic

Further evaluation and discussion of the potential for chemicals detected in subsurface soil to leach to groundwater is presented in Section 4.2.2.

Another area in SMA 4 was evaluated separately, the Mineral Wool Pile. The material in the Mineral Wool Pile is not soil, instead it is a product being stored on-site until it is sold. Because of the unique nature of this material, it is evaluated separately. In this case, maximum detected chemical concentrations of the mineral wool were screened against industrial soil RSLs to select COPCs evaluation of the industrial worker. This screening approach is very conservative because the mineral wool is not soil and industrial workers do not regularly work on the Mineral Wool Pile. The mineral wool is also screened against residential soil RSLs as a conservative approach to select COPCs used to evaluate the hypothetical risk of an off-site resident exposed to mineral wool, should the material become transported from the pile to air and then dispersed by wind. The conservative nature of this approach for evaluating both of these pathways is discussed further below in Section 3.3.1.

Analytical data pertaining to samples collected from the Mineral Wool Pile include splits, where EPA obtained the split sample and analyzed the material at a separate laboratory. Because all of this data provides a more comprehensive characterization of the mineral wool, all available analytical data is pooled into one population and maximum detected concentrations, regardless of whether the data resulted from primary samples or split samples, were used to compare to RSLs for COPC selection. COPCs selected for the Mineral Wool Pile are presented in Table 3-4.

To develop a list of COPCs for chemicals to be evaluated for human health effects from exposure to groundwater via direct contact pathways, the USEPA RSLs for tapwater (USEPA, Nov. 2015) were used. Chemicals detected in groundwater were retained as COPCs if the maximum detected concentration was found to exceed its tapwater RSL. In the event a tapwater RSL was not available, the MCL was used. COPCs selected for groundwater are presented in Table 3-5.

To develop a list of COPCs for chemicals to be evaluated for the vapor intrusion pathway, screening levels were obtained from USEPA's Vapor Intrusion Screening Level (VISL) Calculator (USEPA, 2015b). COPCs were selected for evaluation of vapor intrusion from on-site groundwater if the maximum concentration was found to exceed the VISL screening level, as presented on Table 3-5.

3.3 Exposure Assessment

The objectives of the exposure assessment are to characterize potentially exposed human receptors at the Site, to identify actual or potential exposure pathways, and to quantify the potential exposure. Thus, the exposure assessment involves several elements, including:

- n Identification of the potential receptors/exposure scenarios (as shown in the Conceptual Site Model [CSM])
- n Identification of exposure routes (also in the CSM)
- n Quantification of exposure point concentrations (EPCs)
- n Identification of the exposure models and assumptions used to calculate daily intakes or doses

3.3.1 Receptors and Pathways Evaluated

The CSM depicts the path a contaminant could theoretically follow from environmental media to intake by the receptor. Figure 3-4 presents the CSM for current SMA 4 soil and groundwater exposure scenarios, and Figure 3-5 presents the CSM for theoretically potential future exposure scenarios. To be highly protective, this HHRA will consider an exposure pathway to be complete as shown on the CSMs even though the occurrence of the theoretically potential future exposure scenarios may be highly unlikely. One additional area has been evaluated independently from SMA 4, the Mineral Wool Pile. Because of unique aspects of this material, and because it is a product and not environmental media, this area has been evaluated separately, and thus, a CSM applicable to just the Mineral Wool Pile has been developed as Figure3-6.

Discussion is presented below for each receptor and the conditions of their potential exposure scenarios. The specific exposure parameters used to calculate assumed chemical intakes, including exposure frequencies and durations for each receptor and pathway to be evaluated in this HHRA are summarized in Table 3-6.

Current and Future Industrial/Commercial Workers

Current and future industrial/commercial workers are assumed to be adult, full-time workers who may be exposed to on-site contaminants. Industrial/commercial workers are assumed to be long-term employees who work at the facility 40 hours/week, 250 days/year, for a duration of 25 years. Their exposure to soil may be through ingestion, dermal absorption, or inhalation of dust particles. Given the nature of organic contaminants in soil, these workers may also be exposed to volatiles in ambient air. Both the current and future industrial worker receptor is evaluated on the assumption of potentially being exposed to surface soil, from a depth of 0 to 1 ft, and, as potentially being exposed to subsurface soil (2 - 15 ft), in a situation where periodic, limited trenching or utility work might be conducted. It is assumed that this latter scenario involves a receptor exposed to subsurface soil in such a manner for up to one work-week per year, each year over the 25 year duration. The worker is assumed to be exposed to soil via incidental ingestion, dermal absorption,

and inhalation; hence, this HHRA considers these pathways complete and they are evaluated in this risk assessment.

Current and future industrial/commercial workers are also evaluated for exposure to the Mineral Wool Pile. For this evaluation, the inhalation pathway of the industrial worker receptor is evaluated as being potentially exposed to this material for 8 hours/day, 250 days/year, over a 25 year duration. This is a conservative approach as the mineral wool is not soil, and the mineral wool pile develops a crusty nature at the surface that acts to limit the material from being dispersed into air. To evaluate ingestion and dermal absorption pathways, another approach is used. The industrial workers at the ERP Coke facility only rarely perform tasks to manage the mineral pile in such a way that potential contact may occur. The Mineral Wool Pile sits idle, without requiring any attention, until sales occur. To evaluate the industrial worker for potential direct contact with the mineral wool, it is conservatively assumed that this receptor may perform some type of management of the material for 3 days/month, 8-hours/day, over the duration of exposure. Pathways shown as being complete for this receptor on Figure 3-6 include mineral wool ingestion, mineral wool dermal absorption, and inhalation of particles and volatile organics.

Groundwater is not currently used at the facility for any potable purpose, nor is it anticipated being used in the future. An ordinance has been passed by the City of Birmingham prohibiting groundwater use for potable purposes. Thus, the groundwater pathway is currently incomplete for, and therefore does not present a risk to, industrial workers, and so the current industrial worker is not evaluated for exposure to groundwater by direct contact. However, in the very unlikely event that groundwater may be available for use sometime in the future, the future industrial worker is evaluated for hypothetical groundwater ingestion and for dermal absorption and inhalation of volatiles while showering. To quantify the latter pathway, the worker is assumed to be in the shower for 20 minutes, remaining in the shower room for 15 minutes afterwards. During this time, the receptor may be exposed to chemicals in water via dermal contact and inhalation of any vapors that may form and linger in the air.

Because some portions of the site are underlain by volatile organic contaminants in groundwater, there also may be a potential for the vapor intrusion pathway to be complete. If this is the case, workers may be exposed to volatiles via the inhalation pathway while working indoors, both currently and in the future. Evaluating the current industrial worker for vapor intrusion is a very conservative approach and is further discussed in Section 3.6, Uncertainty Analysis. Currently, USEPA is re-evaluating their recommended vapor intrusion guidance. USEPA's Vapor Intrusion Screening Level calculator (2015b), is the most current, published risk tool, and is utilized to estimate risks to receptors working in buildings who may be exposed to VOCs.

To summarize, the following pathways are quantitatively evaluated for current industrial workers:

- Soil ingestion
- Soil dermal contact

- n Inhalation of soil particles
- n Inhalation of VOCs from soil in ambient air
- n Mineral wool ingestion
- n Mineral wool dermal contact
- n Inhalation of mineral wool particles
- n Inhalation of VOCs from mineral wool in ambient air
- n Inhalation of vapors inside buildings

The following pathways are quantitatively evaluated for future industrial workers:

- n Soil ingestion
- n Soil dermal contact
- n Inhalation of soil particles
- n Inhalation of VOCs in ambient air
- n Mineral wool ingestion
- n Mineral wool dermal contact
- n Inhalation of mineral wool particles
- n Inhalation of VOCs from mineral wool in ambient air
- n Inhalation of VOCs inside buildings
- n Groundwater ingestion
- n Groundwater dermal contact while showering
- n Inhalation of VOCs while showering with groundwater

Current and Future Construction Workers

Construction activities may occur on-site such that a construction worker could be exposed to site contaminants. Construction workers are not ERP Coke employees, they would be working for a separate company under a contract for limited construction work. Construction workers may be exposed to soil chemicals via ingestion, dermal absorption, and by the inhalation of contaminated dust or VOCs in ambient air. Given that surface soil samples have not been collected during previous investigations of the facility, because of the general absence of such soils in this SMA (as discussed above for the industrial/commercial worker), surface soil samples were collected from the area designated as AOC B. Construction workers are assumed to be exposed to soils at depths from 0 to 1 feet as well as from 2 to 15-feet, although the exposure scenarios for these two depths would likely differ. Construction workers exposed to surface soil would most likely occur only while performing short-term work at shallow depths for such tasks as utility maintenance. For this scenario, construction workers are conservatively assumed to do such utility work at SMA 4 for 3 days/week, 8 hours/day, over the duration of exposure. Alternatively, a construction worker exposed to soil at depths of typical building excavations (15 ft depth), may be involved in more complex and lengthy projects. Hence, a construction worker is evaluated as being exposed to subsurface soil for 250 days/year, 8 hours/day, over a one-year duration of exposure.

While construction workers are not likely to be exposed to groundwater for potable purposes, they may be exposed during trenching if shallow groundwater is encountered. For those areas where groundwater may be shallow enough to be encountered, construction workers are evaluated for their exposure to groundwater via dermal absorption and for the inhalation of VOCs that may collect in the trench. The State of Virginia Department of Environmental Quality (VDEQ) provides a model on their web site to derive the VOC concentration in air that is used to evaluate the inhalation pathway in a trench (VDEQ, 2010).

To summarize, the following pathways are quantitatively evaluated for current and future construction workers:

- n Soil ingestion
- n Soil dermal contact
- n Inhalation of soil particles
- n Inhalation of VOCs in ambient air
- n Groundwater dermal contact while trenching
- n Inhalation of VOCs from groundwater while trenching

Current and Future On-Site Trespassers

The ERP facility is a secure property; however, the potential for trespassers to enter the site can never be 100% eliminated. Risks to an adolescent trespasser are evaluated for an individual that may enter the site infrequently, up to 12 days/year, for 1 hour/day, from age 7 to 16. The trespasser is potentially exposed to surface soil, via soil ingestion, dermal absorption, and inhalation of dust particles and volatiles in ambient air. Given the security at this facility, these exposure assumptions are highly protective and unlikely to occur in reality; hence, this HHRA very likely significantly overestimates risk to trespassers.

Current and Future Off-Site Residents

Current and future off-site residents are evaluated for exposure to contaminated media at the ERP Coke facility, if a complete pathway may exist. In the case of the Mineral Wool Pile, it is theoretically possible that material from the pile may become airborne, disperse in wind, and migrate off-site. In that event, off-site residents in the vicinity may be exposed. Because of this potentially complete pathway, adult and child off-site residents are evaluated for inhalation exposure from contaminants present in the Mineral Wool Pile. Exposure parameters utilized to evaluate off-site residents are those recommended by USEPA (USEPA, 2014) as 24 hours/day, 350 days/year, over a duration of 26 years for adults and 6 years for children. This approach is very conservative, as the mineral wool is not soil and the mineral wool pile develops a crusty nature at the surface and vegetative cover that limits its ability to become airborne (as discussed further in Section 3.6 Uncertainty Analysis).

It is also possible that groundwater migrating off-site may flow beneath homes in the vicinity of the facility. In that event, the presence of volatile organics in groundwater may intrude into these

homes, making the inhalation pathway via vapor intrusion potentially complete. Actual vapor intrusion sampling has been performed during the Vapor Intrusion Study completed for off-site residences for the groundwater plume associated with SMA 4. The Vapor Intrusion Characterization Report (Revision 1.0) was submitted to EPA on February 5, 2015. The summary and conclusions of the VI Report were:

The multiple lines of evidence showed that no further action of any kind is needed or warranted with respect to the potential for vapor intrusion, and those lines of evidence include that:

- n Crawlspace sampling benzene results indicate that no further action is needed or warranted with respect to potential vapor intrusion because:
 - o these results are below or consistent with background ambient air concentrations,
 - o this consistency with background indicates that vapor intrusion is not occurring or presents essentially no potential to increase concentrations in indoor air, and that the crawlspace sampling benzene results are driven by background ambient air concentrations,
 - o trends in soil vapor and crawlspace sampling results support the conclusion that crawlspace sample benzene results are driven by background ambient air concentrations, and
 - o EPA has already determined that the concentrations reflected in the crawlspace sampling benzene results (individually and on average) fall within EPA's acceptable risk range.
- Soil vapor benzene results indicate that no further action is needed or warranted with respect to potential vapor intrusion because the results show that the operation of the hydraulic control system is controlling soil vapor concentrations such that there is no or minimal apparent risk of vapor intrusion.
- During the most recent groundwater sampling event (February 2014), no VOC concentrations in excess of the MCLs were noted in any off-site groundwater monitoring well, demonstrating (1) the effectiveness of the hydraulic control system on plume control and (2) further reduced potential for vapor intrusion at off-facility properties.
- n No other constituents exceed the screening level in the crawlspace samples or in the soil vapor samples.

EPA issued an *Approval to remove Soil Vapor Monitoring Points* letter dated July 2, 2015. This letter concluded that no further action was needed with respect to potential vapor intrusion and that the soil vapor points could be abandoned. The vapor points were abandoned on October 14, 2015, in accordance with the EPA-approved Work Plan.

Thus, the Vapor Intrusion Study showed, and EPA agreed, that no further attention to vapor intrusion by way of study or corrective action was warranted. Thus, further evaluation of this pathway to offsite residents in this CMS is not needed. In particular, it should be noted that the Vapor Intrusion Study results demonstrate that the vapor intrusion pathway is very likely entirely incomplete because any crawlspace detections of COPCs were consistent with and generally below the background concentrations of those COPCs in ambient air. Consequently, vapor intrusion risk to off-site residents is not considered further in this CMS.¹

To summarize, the following pathway is quantitatively evaluated for off-site residents:

- Inhalation of constituents associated with the Mineral Wool Pile

3.3.2 Exposure Point Concentrations

An exposure point is a location where, for the purposes of risk assessment, a receptor is assumed to move at random, throughout the duration of exposure, and where contact with an environmental medium is equally likely at all sub-locations. The chemical concentration developed to represent that exposure is termed the exposure point concentration (EPC). Because of the randomness assumed for exposure, an EPC is derived as an estimate of the true arithmetic mean concentration of a chemical in a medium at an exposure location. However, because the true arithmetic mean concentration cannot be calculated with certainty from a limited number of measurements, USEPA recommends that the 95th percentile upper confidence limit (UCL) of the arithmetic mean at each exposure point be used when calculating exposure and risk at that location (USEPA, 1992). Further, if the 95% UCL exceeds the highest detected concentration, the highest detected value is used instead (USEPA, 1989).

USEPA has developed statistical software to aid the development of EPCs for a chemically contaminated site. This software, ProUCL version 5.0.0 (USEPA, 2013) was utilized to develop EPCs for each environmental media. The EPC selected was either the 95%UCL or the maximum detected concentration, whichever was less. In some cases, ProUCL cannot compute a UCL; for example, with too few sample results or too few detections in a large data set. In those cases, the maximum chemical concentration was selected as the EPC. EPCs are presented for the COPCs of SMA 4 surface soil in Table 3-7 and subsurface soil in Table 3-8. EPCs for the mineral wool are presented in Table 3-9. EPCs for on-site groundwater beneath SMA 4 are presented on Table 3-10.

¹ Full consideration of this pathway in this HHRA would have confirmed this conclusion, in any event. Based on the sampling results for the off-site wells, the VISL vapor intrusion ELCR for the off-site resident is within EPA's acceptable risk range of 1E-06 to 1E-04, and the vapor intrusion HI for the off-site resident is far below the level of 1.0.

Because some EPCs are represented by UCLs, as calculated by ProUCL, the printouts from ProUCL are included in the very beginning of Appendix B. Separate print-outs are provided for surface soil, subsurface soil, the Mineral Wool Pile, and groundwater.

Once the EPCs were calculated for each media in each exposure area, a receptors' chemical intake was calculated, as described below.

3.3.3 Estimating Chemical Intake

Methodology to estimate chemical intake from the various exposure pathways is described further below.

3.3.3.1 Intake of Chemicals from Exposure to Soil and Mineral Wool

The equations presented below are those recommended by USEPA for intake specifically in regard to soil. As this is the only approach available for evaluating intake of particles, mineral wool intake is quantified using these same equations. This is a conservative approach, as the material in the Mineral Wool Pile develops a crusty nature at the surface that will act to limit its intake.

Ingestion

Average daily chemical intake for the incidental ingestion of soil is calculated by use of the following formula (USEPA, 1989):

$$DI_{\text{Ingestion}} = \frac{CS \times IR \times CF \times FI \times EF \times ED}{BW \times AT}$$

where:

- $DI_{\text{Soil-Ing}}$ = average daily chemical intake via soil ingestion (mg/kg-day)
- CS = chemical concentration in soil (mg/kg)
- IR = ingestion rate (mg soil/day)
- CF = conversion factor (10^{-6} kg/mg)
- FI = fraction ingested from contaminated source (unitless)
- EF = exposure frequency (days/year)
- ED = exposure duration (years)
- BW = body weight (kg)
- AT = averaging time (period over which exposure is averaged, days)

Spreadsheets depicting the calculated assumed chemical intake from ingestion of surface soil by industrial workers, construction workers, and adolescent trespassers are presented in Appendix B on Tables B1.1, B1.2, and B1.3, respectively. Calculated assumed chemical intake via ingestion of subsurface soil by industrial workers and construction workers presented on Tables

B1.4 and B1.5. Calculated assumed chemical intake via ingestion of mineral wool by industrial workers are presented on Table B1.6.

Inhalation

For the purposes of evaluating a receptor's assumed exposure to chemicals in ambient air, as either volatiles or adsorbed to particles, the development of the exposure concentration (EC) in air, as recommended by USEPA's *RAGS Part F, Guidance for Inhalation Risk Assessment* (USEPA, 2009), must be performed. EC is calculated by modeling the contaminant concentrations (CA) in air first, following the methodology presented in USEPA's *Soil Screening Guidance* (USEPA, 2002a). EC will be determined by using the following equation:

$$EC = \frac{CA \times ET \times EF \times ED}{AT}$$

where:

- EC = exposure concentration ($\mu\text{g}/\text{m}^3$)
- CA = chemical concentration in air ($\mu\text{g}/\text{m}^3$)
- ET = exposure time (hours/day)
- EF = exposure frequency (days/year)
- ED = exposure duration (years)
- AT = averaging time (period over which exposure is averaged, days)

The chemical concentration in air (CA) term will be calculated as follows:

$$CA = CS \times [(1 / PEF) + (1 / VF)]$$

where:

- PEF = Particle emission factor (m^3/kg); $5.70\text{E}+09 \text{ m}^3/\text{kg}$ (default value) (USEPA, 2002a)
- VF = Volatilization factor (m^3/kg).

Additionally, the following equation was used to derive VF, as described by USEPA's *Supplemental Guidance for Developing Soil Screening Levels for Superfund Sites* (2002).

$$VF = [Q/C \times (3.14 \times D_A \times T)^{1/2} \times CF] / (2 \times \rho_b \times D_A)$$

where:

- Q/C = inverse of mean concentration at center of source ($\text{g}/\text{m}^2\text{-s}$ per kg/m^3)
- D_A = apparent diffusivity (cm^2/sec)
- T = exposure interval (sec)
- CF = conversion factor, $10^{-4} \text{ m}^2/\text{cm}^2$
- ρ_b = dry soil bulk density (g/cm^3) = $1.5 \text{ g}/\text{cm}^3$

Additionally, the following equation was used to derive D_A (USEPA, 2002).

$$D_A = [(\theta_a^{10/3} \times D_i \times H') + (\theta_w^{10/3} \times D_w) / n^2] / [(\rho_b \times K_d) + \theta_w + (\theta_a \times H')]$$

where:

- θ_a = air filled porosity (L_{air}/L_{soil}) = $n - \theta_w = 0.284$
- D_i = diffusivity in air (cm^2/sec), chemical specific
- H' = Henrys law constant, unitless, chemical specific
- θ_w = water-filled porosity (L_{water}/L_{soil}) = 0.15
- n = total soil porosity (L_{pore}/L_{soil}) = $1 - (\rho_b/\rho_s) = 0.434$
- K_d = soil-water partition coefficient, cm^3/g

The following equation was used to derive K_d (USEPA, 2002).

$$K_d = K_{OC} \times f_{OC}$$

where:

- K_{OC} = soil organic carbon partition coefficient (cm^3/g), chemical specific
- f_{OC} = fraction organic carbon in soil (g/g), 0.006

Tables B1.7 through B1.21, in Appendix B, illustrate the calculated values for the above described parameters (K_d , Q/C , DA , and VF), resulting in CA for each COPC, for surface soil, subsurface soil, and mineral wool of SMA 4. Tables B1.22, B1.23, and B1.24 present the calculated assumed ECs for industrial workers, construction workers, and adolescent trespassers exposed to surface soil of SMA 4, respectively. Tables B1.25 and B1.26 presents the calculated assumed EC for industrial workers and construction workers exposed to subsurface soil of SMA 4. Tables B1.27, B1.28, and B1.29 presents the calculated assumed EC for industrial workers, adult residents, and child residents, relative to the theoretically potential pathway from the Mineral Wool Pile.

The child resident receptor presents a unique scenario with respect to quantifying assumed exposure. This receptor is evaluated for assumed exposure to chemicals that may invoke a mutagenic response. The mutagenic evaluation is discussed further below in Section 3.4.3, where it is explained that an Age-Dependent Adjustment Factor is applied for certain time periods of a child's life. These time periods are from 0 to 2 and 2 to 6 years. Because of this, intake was calculated separately for these time periods as shown on Table B1.29.

Dermal Absorption

Average daily chemical intake for dermal absorption of chemicals in soil was calculated by use of the following formula (USEPA, 2004):

$$DAD = \frac{DA_{event} \times EF \times ED \times EV \times SA}{BW \times AT}$$

where:

DAD = dermal absorbed dose (mg/kg-day)
DA_{event} = absorbed dose per event (mg/cm²-event)
EF = exposure frequency (days/year)
ED = exposure duration (years)
EV = event frequency (events/day)
SA = skin surface area available for contact (cm²)
BW = body weight (kg)
AT = averaging time (period over which exposure is averaged, days)

The DA_{event} term was calculated by the following formula (USEPA, 2004):

$$DA_{event} = CS \times CF \times AF \times ABS_d$$

where:

DA_{event} = absorbed dose per event (mg/cm²-event)
CS = chemical concentration in soil (mg/kg)
CF = conversion factor (10⁻⁶kg/mg)
AF = adherence factor of soil to skin (mg/cm²-event)
ABS_d = dermal absorption fraction

Tables B1.30, B1.31, and B1.32, in Appendix B, present the calculated values for DA_{event} for surface soil, subsurface soil, and mineral wool, respectively. Tables B1.33, B1.34, and B1.35 present the dermal absorbed dose (DAD) for industrial workers, construction workers, and adolescent trespassers exposed to surface soil, respectively. Tables B1.36 and B1.37 presents the calculated assumed DAD for the industrial workers and construction workers exposed to subsurface soil. Table B1.38 presents the calculated assumed DAD for industrial workers exposed to mineral wool.

3.3.3.2 Intake of Chemicals from Exposure to Groundwater

Ingestion

Assumed average daily chemical intake for the ingestion of groundwater as drinking water was calculated by use of the following formula (USEPA, 1989):

$$DI_{Ingestion} = \frac{CW \times IR \times EF \times ED}{BW \times AT}$$

where:

DI_{Ingestion} = average daily chemical intake via groundwater ingestion (mg/kg-day)
CW = chemical concentration in groundwater (mg/L)
IR = intake rate (L/day)
EF = exposure frequency (days/year)
ED = exposure duration (years)

BW = body weight (kg)

AT = averaging time (period over which exposure is averaged, days)

Calculated assumed average daily chemical intake via groundwater ingestion at SMA 4 was calculated for the industrial worker and presented on Tables B2.1 of Appendix B.

Dermal Absorption

Assumed average daily chemical intake for dermal absorption of chemicals in groundwater via direct contact by industrial workers during showering, in the event groundwater is available for use at some time in the future, was calculated by use of the following formula (USEPA, 2004):

$$DAD = \frac{DA_{event} \times EF \times ED \times EV \times SA}{BW \times AT}$$

where:

for organics: $DA_{event} = C_{shw} \times K_p \times 2 \times FA \times \text{SQRT}(6 \times \tau \times t_{event}/p)$

for inorganics: $DA_{event} = C_{shw} \times K_p \times t_{event}$

and

$C_{shw} = CW \times f \times CF1 \times CF2$

DAD = dermal absorbed dose (mg/kg-day)

DA_{event} = absorbed dose per event (mg/cm²-event)

C_{shw} = concentration remaining in shower water (mg/cm³)

CW = chemical concentration in groundwater (µg/L)

f = fraction in shower water after volatilization (NA for inorganics or f = 1)

CF1 = conversion factor (mg/µg)

CF2 = conversion factor (L/cm³)

K_p = dermal permeability coefficient in water (cm/hr)

FA = fraction of chemical absorbed

t_{event} = exposure time in shower (hr), 20 minutes

t^* = time to reach steady-state (hr)

τ = lag time per event (hr)

EF = exposure frequency (days/year), each work day for 25 years

ED = exposure duration (years)

EV = event frequency (events/day)

SA = skin surface area available for contact (cm²)

BW = body weight (kg)

AT = averaging time (period over which exposure is averaged, days)

The assumed concentration remaining in the shower after volatilization (C_{shw}) was calculated for COPCs in groundwater, as shown on Table B2.2, presented in Appendix B. The DA_{event} term was also calculated for COPCs in groundwater, with results presented on Table B2.3, in Appendix

B. The calculated assumed average daily chemical intake from dermal contact with groundwater while showering is presented on Table B2.4 in Appendix B.

The assumed average daily chemical intake for dermal absorption of chemicals in groundwater for the construction worker, who may be exposed if groundwater pools in a trench, was calculated using the following formula (USEPA, 2004):

$$ADI_{\text{GW-Derm}} = \frac{CW \times SA \times PC \times ET \times EF \times ED \times CF}{BW \times AT}$$

where:

$ADI_{\text{GW-Derm}}$ = average daily absorbed chemical dose (mg/kg-day)

CW = chemical concentration in groundwater (mg/L), as represented by the EPC

SA = skin surface area available for contact (cm²)

PC = chemical-specific dermal permeability constant (cm/hour)

ET = exposure time (hours/day)

EF = exposure frequency (days/year)

ED = exposure duration (year)

CF = conversion factor for water (1 L/1000 cm³)

BW = body weight (kg)

AT = averaging time (period over which exposure is averaged, days)

For construction workers who may be dermally exposed to contaminants in groundwater while trenching, the same formula used for calculating the assumed dermal absorbed dose (DAD), as described just above, except that exposure parameters are selected that better reflect the skin surface area affected and the time/duration of exposure for this scenario. The construction worker is evaluated as being in contact with pooled water in a trench for 2 hours/day and 125 days/year.

The average chemical intake calculations for the construction worker can be found on Table B2.5 in Appendix B.

Inhalation

The inhalation pathways involving contaminated groundwater are primarily those that are affected by the phase change of dissolved VOCs in groundwater to vapors in air. These pathways include inhalation of vapors inside buildings from vapor intrusion, inhalation of vapors in trenches for construction workers who encounter contaminated groundwater, and individuals who may be exposed to VOCs while showering.

Industrial workers are evaluated assuming they might shower with site groundwater. Modeling is required to estimate the indoor air concentrations of VOCs from groundwater while showering. In this scenario, receptors are assumed to inhale VOCs while showering and during time spent in the bathroom after showering. The shower model described by Schaum et al., (1994), was used

to evaluate exposure to COPCs in groundwater for future industrial/commercial workers who may take a shower on site.

The shower model treats the bathroom as one compartment and yields an air concentration averaged over the time of the actual shower and the time spent in the bathroom after the shower. The model was derived by assuming that the chemical volatilizes at a constant rate, instantly mixes uniformly with the bathroom air, and that ventilation with clean air does not occur. This implies that the chemical concentration in the air increases linearly from zero to a maximum at the end of the shower, and then remains constant during the time an individual spends in the bathroom immediately after showering.

The equation used to estimate chemical intake by inhalation during showering is the same as for inhalation of soil above, except for the following:

$$CA = \frac{((CA_{\max}/2) \times t_1) + (CA_{\max} \times t_2)}{(t_1 + t_2)}$$

where:

$$CA_{\max} = CW \times f \times Fw \times t_1 \times 1/Va$$

and where:

CW	=	chemical concentration in groundwater (µg/L)
CA	=	chemical concentration in air (µg/m ³)
f	=	fraction volatilized, chemical-specific
Fw	=	water flow rate (L/hr), assumed to be 1000 L/hr
t ₁	=	time of shower (hr), assumed to be 20 minutes
Va	=	bathroom volume (m ³), assumed to be 12 m ³
t ₂	=	time after shower in bathroom (hr), assumed to be 15 minutes

CA_{max} was calculated for each COPC, and then used to determine the concentration of the chemical in air (CA). Calculations for CA_{max} and CA are found in Appendix B, Tables B2.6 and B2.7, respectively.

Inhalation of VOCs by construction workers during trenching or excavation activities was evaluated following the approach offered by the Virginia Department of Environmental Quality's (VDEQ's) guidelines for situations where shallow contaminated groundwater may pool in an excavation. The VDEQ spreadsheet (VRP 37, Table 3-8, Groundwater: Construction Worker in a Trench, for groundwater < 15 ft from soil surface) was utilized to develop VOC concentrations in air. This table was obtained on-line at VDEQ's website:

<http://www.deq.virginia.gov/Programs/LandProtectionRevitalization/RemediationPrograms/VoluntaryRemediationProgram/VRPRiskAssessmentGuidance/Guidance.aspx>.

To evaluate volatiles collecting in a trench, the trench dimensions (as a default scenario) are assumed to be 8 feet long by 3 feet wide, to a depth of 8 feet. The concentrations of the volatile chemicals in groundwater that may collect in the trench, are shown on Table B2.8 in Appendix B.

The exposure concentration available in air for the industrial worker to inhale while showering is calculated by using the formula below:

$$EC = \frac{CA \times ET \times EF \times ED \times CF}{AT}$$

where:

EC	=	exposure concentration ($\mu\text{g}/\text{m}^3$)
CA	=	chemical concentration in air ($\mu\text{g}/\text{m}^3$)
ET	=	exposure time (hours/day)
EF	=	exposure frequency (days/year)
ED	=	exposure duration (years)
CF	=	conversion factor (1 day/24 hours)
AT	=	averaging time (period over which exposure is averaged, days)

Using CA, the assumed EC for an industrial worker showering with site groundwater was calculated, as shown on Table B2.9 in Appendix B.

Using the calculated assumed COPC concentration in air, the EC available for inhalation by the construction worker who may inhale volatiles in a trench, was calculated as shown on Table B2.10 in Appendix B.

Currently, the USEPA is re-evaluating the methodology to estimate risks via the vapor intrusion pathway. Inhalation of VOCs while indoors, via the vapor intrusion pathway, was evaluated for on-site industrial workers and off-site residents by using the OSWER Vapor Intrusion Assessment Groundwater Concentration to Indoor Air Concentration Calculator Version 3.2, using USEPA Nov. 2015 RSLs. Cancer risks and noncancer hazards are provided for commercial (industrial) workers scenario with the groundwater volatile COPC exposure point concentrations used as input. The calculator was utilized with default settings, as a conservative approach. Results are discussed and presented in Section 3.5 below.

3.4 Toxicity Assessment

The toxicity assessment identifies the toxicity values (i.e. slope factors and reference doses) for COPCs. These toxicity values are applied to the assumed doses (intakes) calculated in the exposure assessment, in order to evaluate carcinogenic risk and noncarcinogenic hazard. The Integrated Risk Information System (IRIS) (USEPA, accessed on-line) is the preferred source of toxicity values, as the Tier 1 option. If a toxicity value was not available through IRIS, USEPA's recommended hierarchy of toxicity databases was followed (per USEPA, 2003) which suggests

that the Tier 2 option should be the Provisional Peer Reviewed Toxicity Values (PPRTVs) developed by The Office of Research and Development(ORD)/National Center for Environmental Assessment (NCEA). If toxicity values are not available in the Tier 1 or 2 options, USEPA suggests that three Tier 3 sources may be consulted, comprised of the following sources:

- n California Environmental Protection Agency (Cal EPA) toxicity values available at the Cal EPA internet website: <http://www.oehha.ca.gov/risk/chemicalDB//index.asp>.
- n Agency for Toxic Substances and Disease Registry (ATSDR) Minimal Risk Levels (MRLs) available online at: <http://www.atsdr.cdc.gov/mrls.html> on the ATSDR website.
- n EPA Health Effects Assessment Summary Tables (HEAST), available on-line at: <https://epa-heast.ornl.gov/>.

3.4.1 Carcinogenicity Evaluation

Carcinogenic oral slope factors (SFs) are presented on Table 3-11, containing the following information for each COPC: weight of evidence, and for oral, inhalation, and dermal pathways, tumor site(s), unit risk values, and SFs. References are provided as necessary.

Presently, toxicological data do not exist from which dermal SFs can be derived. To evaluate the dermal pathway, USEPA has adopted methodology to obtain dermal SFs by adjusting the oral SFs. The equation for extrapolation of a default dermal SF is as follows:

$$\text{Default Dermal SF} = \text{Oral SF} / \text{Oral Absorption Factor (\%)}$$

Dermal SFs are also presented on Table 3-11 and include the oral absorption factor (oral bioavailability) data properly referenced.

Inhalation cancer risks are calculated by use of the Inhalation Unit Risk (IUR) Factors; Table 3-12 provides a list of IURs utilized, along with the appropriate source referenced.

3.4.2 Noncarcinogenic Hazards Evaluation

Oral reference doses (RfDs) are derived from toxicological data and can be obtained from USEPA toxicological databases, such as IRIS. However, for the dermal pathway, oral RfDs are adjusted to derive dermal RfDs in an approach similar as that described above for the derivation of dermal SFs, and as follows:

$$\text{Dermal RfD} = \text{Oral RfD} \times \text{Oral Absorption Factor (\%)}$$

Noncarcinogenic oral RfDs are presented on Table 3-13, and for each COPC include the critical effect/target organ affected and are properly referenced. Table 3-13 also contain dermal RfDs, and includes the oral absorption factors for each COPC along with the proper reference.

Inhalation noncancer risks are calculated by use of the inhalation reference concentrations (RfCs); Table 3-14 provides a list of IURs utilized, along with the appropriate source referenced.

3.4.3 Mutagenic Evaluation

Some receptors are highly sensitive to chemicals that demonstrate a mutagenic mode of action. The most sensitive of such receptors are children and adolescents. Because the adolescent trespasser and off-site child resident receptor are evaluated in this risk assessment, an adjustment is required while calculating the excess lifetime cancer risks to account for the special case of mutagenicity.

Chemicals selected as COPCs for receptors below the age of 17 in this risk assessment that are evaluated as possessing mutagenic modes of action (per USEPA, 2005) include the following: chromium, benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, benzo(k)fluoranthene, dibenz(a,h)anthracene, indeno(1,2,3-cd)pyrene, methylene chloride, tetrachloroethylene, and trichloroethylene.

To make the necessary adjustment for mutagenicity, an Age-Dependent Adjustment Factor (ADAF) is applied. The child under the age of two requires an ADAF of 10, and between the ages of 2 to < 16, requires and ADAF of 3 (USEPA, 2005). These calculations are shown on all risk characterization tables in Appendix B (discussed further below in Section 3.5), which present risk results for off-site child residents and adolescent trespassers.

3.5 Risk Characterization

The objective of the risk characterization step is to integrate the information developed in the exposure assessment and the toxicity assessment into an evaluation of the potential current and future health risks associated with the COPCs at the Site. Potential cancer risk was calculated by multiplying the estimated lifetime-averaged daily intake that is calculated for a chemical through an exposure route by the exposure route-specific cancer slope factor, as described below.

$$\text{ELCR} = \text{DI} \times \text{SF}$$

where:

ELCR	=	Excess Lifetime Cancer Risk (unitless)
DI	=	Daily intake of chemical (mg/kg-day)
SF	=	Cancer slope factor (mg/kg-day) ⁻¹

To account for mutagenicity, the following formula is used for receptors below the age of 16, for chemicals denoted as having mutagenic properties:

$$ELCR = DI \times SF \times ADAF$$

where:

ADAF = Age-dependent adjustment factor (unitless)

Excess cancer risk for the inhalation pathway was estimated by utilizing the following formula (USEPA, 2009):

$$CR_{\text{Inhalation}} = IUR \times EC$$

where:

$ELCR_{\text{Inhalation}}$ = cancer risk via the inhalation pathway (unitless)

IUR = inhalation unit risk $[(\mu\text{g}/\text{m}^3)^{-1}]$

EC = exposure concentration $(\mu\text{g}/\text{m}^3)$

To account for mutagenicity, the following formula is used for receptors below the age of 16, for chemicals denoted as having mutagenic properties:

$$CR_{\text{Inhalation}} = IUR \times EC \times ADAF$$

Cancer risks by pathway and then pathway risks summed to obtain the cumulative cancer risk to a receptor from all chemicals and from all exposure routes.

The potential for noncarcinogenic health effects was evaluated by the calculation of hazard quotients (HQs) and hazard indices (HIs) (which are HQs summed). An HQ is the ratio of the exposure duration-averaged estimated daily intake through a given exposure route to the chemical and route-specific reference dose, calculated as presented below.

$$HQ = DI / RfD$$

where:

HQ = Hazard quotient (unitless)

DI = Daily chemical intake (mg/kg-day)

RfD = Noncancer reference dose (mg/kg-day)

The HQ for the inhalation pathway was calculated by using the following formula (USEPA, 2009):

$$HQ_{\text{Inhalation}} = EC / [\text{Toxicity Value} \times 1000 \mu\text{g}/\text{m}^3]$$

where:

HQ = hazard quotient via the inhalation pathway (unitless)

EC = exposure concentration ($\mu\text{g}/\text{m}^3$)
Toxicity Value = inhalation toxicity value (e.g. RfC)

HQs are summed to obtain HIs for each receptor scenario. Initially, HIs are calculated based on all chemicals and exposure routes. Following the calculation of cumulative noncancer risks, any receptors which exhibit an HI greater than 1.0 are further evaluated to determine if multiple organ effects are demonstrated. If so, chemicals are segregated by organ effect and cumulative noncancer risks (HIs) are obtained for the target organs and systems.

Risk Results for Surface Soil

Industrial workers, construction workers, and adolescent trespassers were evaluated for their potential exposure to surface soil of SMA 4. The calculated results for each chemical and pathway are presented on Tables B3.1, B3.2, and B3.3 for industrial workers, construction workers, and trespassers, respectively. Risk results for these receptors also are summarized on Table 3-15.

For industrial workers, the total excess lifetime cancer risk (ELCR) from exposure to chemicals in surface soil over all pathways was found to be $4.6\text{E-}05$, which falls within EPA's acceptable risk range of $1\text{E-}06$ to $1\text{E-}04$. Individual chemicals that result in ELCRs greater than $1\text{E-}06$ include: benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, dibenz(a,h)anthracene, indeno(1,2,3-cd)pyrene, arsenic, and chromium. The noncancer HI result for the industrial worker is 0.08, far below the level of concern of 1.0. There are no individual chemicals with HQs greater than 0.1.

For construction workers, the total ELCR from exposure to chemicals in surface soil, summed over all pathways, was found to be $6.7\text{E-}07$, which falls below EPA's acceptable risk range of $1\text{E-}06$ and $1\text{E-}04$. The noncancer HI result for the construction worker is 0.03, far below the level of concern of 1.0. There are no individual chemicals with HQs greater than 0.1.

For adolescent trespassers, the total ELCR from exposure to chemicals in surface soil, summed over all pathways, was found to be $5.6\text{E-}06$, which falls within EPA's acceptable risk range of $1\text{E-}06$ and $1\text{E-}04$. Only one individual chemical resulted in an ELCR greater than $1\text{E-}06$, benzo(a)pyrene. The noncancer HI result for the trespasser is 0.01, which is far below the level of concern of 1.0. As such, there are no individual chemical HQ results found to be greater than 0.1 for this receptor.

Risk Results for Subsurface Soil

Industrial workers and construction workers were evaluated for their exposure to subsurface soil of SMA 4. The calculated results for each chemical and pathway are presented on Tables B3.4 and B3.5 for industrial workers and construction workers, respectively. Risk results for these receptors also are summarized on Table 3-16.

For industrial workers, the total excess lifetime cancer risk (ELCR) from exposure to chemicals in subsurface soil over all pathways was found to be $9.5\text{E-}07$, which is a level of risk far below EPA's acceptable risk range of $1\text{E-}06$ to $1\text{E-}04$; thus, EPA considers this risk level acceptable. The noncancer HI result for the industrial worker is 0.01, far below the level of concern of 1.0.

For construction workers, the total ELCR from exposure to chemicals in subsurface soil, summed over all pathways, was found to be $4.2\text{E-}06$, which falls within EPA's acceptable risk range of $1\text{E-}06$ and $1\text{E-}04$. Only one individual chemical has an ELCR greater than $1\text{E-}06$, benzo(a)pyrene. The noncancer HI result for the construction worker is 0.8, which is below the level of concern of 1.0. The individual chemical HQs found to be greater than 0.1 are benzene, chlorobenzene, and toluene.

Risk Results for the Mineral Wool

Industrial workers and off-site residents were evaluated for their theoretically potential exposure to the Mineral Wool Pile. The calculated assumed results for each chemical and pathway are presented on Tables B3.6, B3.7, and B3.8 for industrial workers, adult off-site residents, and child off-site residents, respectively. All risk results for this media are summarized on Table 3-17.

For industrial workers, total ELCR from exposure to chemicals in mineral wool over all pathways was found to be $1.1\text{E-}06$, which falls within EPA's acceptable risk range of $1\text{E-}06$ to $1\text{E-}04$. No individual chemical ELCRs are greater than $1\text{E-}06$. The noncancer HI result is 0.002, far below the level of concern of 1.0.

For adult residents, ELCR from the assumed potential exposure to chemicals in mineral wool via inhalation was found to be $1.9\text{E-}07$. For child residents, ELCR was found to be $2.3\text{E-}07$. This risk result takes into account the added effects from exposure to mutagenic chemicals. These levels of risk far below EPA's acceptable risk range of $1\text{E-}06$ to $1\text{E-}04$; thus, EPA considers these risk levels acceptable. The noncancer HI result for adults is $8.6\text{E-}05$ and for children is $1.7\text{E-}04$, both of which far below the level of concern of 1.0.

Risk Results for Groundwater

Future industrial workers were evaluated for exposure to on-site groundwater via ingestion, dermal contact while showering, inhalation of volatiles while showering, and inhalation of volatiles via vapor intrusion into a building. Current and future construction workers were evaluated for exposure to groundwater via dermal contact if groundwater is encountered during trenching and inhalation of volatiles that may collect in a trench. Table B3-9 presents the risk calculation results for industrial workers, for all pathways except vapor intrusion, which is discussed separately below. Table B3-10 presents the risk calculation results for construction workers. Risk results for these workers are also summarized in Table 3-18.

For future industrial workers, the ELCR from exposure to chemicals in groundwater, summed over all pathways, was found to be $1.3\text{E-}02$, which exceeds EPA's acceptable risk range of $1\text{E-}06$ to

1E-04. Multiple individual chemicals have ELCR results that exceed 1E-06, including: vinyl chloride, benzene, 1,2-dichloroethane, 1,4-dioxane, 1,2,4-trichlorobenzene, 1,4-dichlorobenzene, pentachlorophenol, naphthalene, benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, dibenz(a,h)anthracene, and indeno(1,2,3-cd)pyrene. The noncancer HI result for the future industrial worker is 330, which also exceeds the level of concern of 1.0. Multiple chemicals contribute to this HI, those with individual HQs exceeding 0.1 include: vinyl chloride, methylene chloride, cis-1,2-dichloroethene benzene, 1,2-dichloroethane, trichloroethene, toluene, chlorobenzene, 1,2,4-trichlorobenzene, 1,4-dichlorobenzene, pentachlorophenol, and naphthalene.

Because the HI exceeds 1.0 for future industrial workers exposed to groundwater, further evaluation is warranted. HQs are segregated by target organ and system, and then summed to show the resulting HIs. HQs for the future industrial workers are segregated by target organ and system on Table 3-19. Results show that an HI of 1.0 is exceeded for chemicals affecting the liver (HI of 180), the kidneys (HI of 180), lymphocytes (HI of 140), the central nervous system (HI of 3.2), the immune system (HI of 140), and the endocrine system (HI of 2.8). HI results less than 1.0, but greater than 0.1, are shown for the thymus, the nasal system, and body weight.

For construction workers, the total ELCR from exposure to chemicals in groundwater, summed over all pathways, was found to be 5.6E-04, which exceeds EPA's acceptable risk range of 1E-06 and 1E-04. Multiple individual chemicals have ELCRs greater than 1E-06 including: vinyl chloride, benzene, 1,2-dichloroethane, and 1,4-dichlorobenzene. The noncancer HI result for the construction worker is 370, which exceeds the level of concern of 1.0. The individual chemical HQs found to be greater than 0.1 are: vinyl chloride, benzene, 1,2-dichloroethane, trichloroethene, toluene, chlorobenzene, 1,2,4-trichlorobenzene, and naphthalene.

Because the HI exceeds 1.0 for construction workers exposed to groundwater, further evaluation is warranted. HQs are segregated by target organ and system, and then summed to show the resulting HIs. HQs for the construction workers are segregated by target organ and system on Table 3-19. Results show that an HI of 1.0 is exceeded for chemicals affecting the liver (HI of 200), the kidneys (HI of 210), lymphocytes (HI of 160), the immune system (HI of 160), and the endocrine system (HI of 2.8). HI results less than 1.0, but greater than 0.1, are shown for the central nervous system, the thymus, the nasal system, and body weight.

To evaluate vapor intrusion risk to industrial workers, groundwater vapor intrusion COPC exposure point concentrations are input into the USEPA's VISL calculator to derive the associated cancer risk and noncancer hazard. The receptor scenario was set in the calculator as the "commercial worker". All program default parameters were utilized for this effort. Vapor Intrusion risk results, as produced by the VISL calculator, are shown on Table B3.11 for on-site industrial workers. These results are summarized on Table 3.20.

The VISL vapor intrusion ELCR for the industrial worker is $2.7\text{E-}03$, which exceeds the EPA's acceptable risk range of $1\text{E-}06$ to $1\text{E-}04$. Individual chemicals with ELCRs greater than $1\text{E-}06$ for the industrial worker include: vinyl chloride, benzene, 1,2-dichloroethane, and 1,4-dichlorobenzene. The vapor intrusion HI for the industrial worker is 292. Individual chemical with HQs greater than 0.1 for the industrial worker include: vinyl chloride, benzene, 1,2-dichloroethane, toluene, chlorobenzene, and 1,2,4-trichlorobenzene. The major contributors to excess risk for the industrial worker from vapor intrusion is benzene (HQ of 31) and chlorobenzene (HQ of 260).

Site-Wide Cumulative Risks

Risk results for each receptor were summed across all environmental media to derive the cumulative site-wide risk. The cumulative risks for each receptor are presented on Table 3-21. Cumulative ELCRs exceed $1\text{E-}04$ for the following receptors: current and future industrial workers and current and future construction workers. For both of these receptors, the primary media of concern is groundwater. For noncancer effects, the HIs exceed 1.0 for the same receptors, and again, the primary media of concern is groundwater.

The site-wide cumulative risks for all other receptors, or potential receptors, is acceptable.

Sites with cumulative risk results in exceedance of $1\text{E-}04$ for cancer effects, and HIs greater than 1.0 for noncancer hazards, are evaluated further to determine if remediation may be warranted. For SMA 4 receptors demonstrating cumulative site risks greater than $1\text{E-}04$, Preliminary Clean-up Standards (PCSs) were calculated for soil and groundwater for any chemical which demonstrated an individual ELCR exceeding $1\text{E-}06$ and an individual HQ of 0.1. Methodology used to calculate PCSs and the PCS results are presented in Section 3.7 below.

3.6 Uncertainty Analysis

There are a number of factors that contribute uncertainty to the estimates of exposure and risk presented above, which may result in an underestimation or overestimation of risk. Some of these factors are presented below.

Uncertainties Related to the Selection of COPCs

One area of uncertainty that leads to a likely overestimation of risk is retaining chemicals as COPCs that are demonstrated as having very low frequencies of detection. USEPA's RAGs Part A guidance (1989) suggests that chemicals infrequently detected may be eliminated as COPCs, as they are not likely to present a health threat at the level which merits quantification. In this HHRA, no chemicals were eliminated from selection as COPCs because of low frequency of detection (to comport with USEPA Region 4 guidance [2014]). However, for the on-site groundwater chemicals listed below, they have been detected at a rate of less than 5% and have risk results showing individual ELCRs greater than $1\text{E-}06$ and/or HQs greater than 0.1:

- 1,2-Dichloroethane – detected in 1 out of 67 samples
- Trichloroethene – detected in 3 out of 67 samples
- Pentachlorophenol – detected in 1 out of 43 samples

Risk results for these three compounds in groundwater are likely to be overestimated.

Uncertainties Related to Exposure Parameters

When evaluating exposure, probable scenarios are developed to estimate conditions and durations of human contact with a COPC. Scenarios are based on observations or assumptions about the current or potential activities of human populations that could result in exposure. To prevent underestimations of risk, scenarios incorporate exposure levels, frequencies, and durations at or near the top end of the range of probable values. This reasonable maximum exposure (RME) approach is one that may be at the high end of the range of possible exposures, resulting in very protective assumptions.

Default values, such as ingestion rates, are used in the exposure calculations to quantify intakes. Although these values are based on USEPA-validated data, there is uncertainty in the applicability of such values to any particular exposed population or individual. To compensate for this uncertainty, the default values are typically set to the upper end (usually the 90th or 95th percentile) of the normal range, resulting in very protective assumptions.

Uncertainty Related to Toxicological Values

Uncertainties based upon derivation and use of toxicological values are inherent in each risk characterization. Some of these include:

- n The use of animal data to predict potential human health effects.
- n Extrapolation of experimental data obtained by exposing animals to high chemical doses to the likely outcome in humans following exposure to low chemical levels in the environment.
- n The use of conservatively derived toxicological criteria.
- n The lack of toxicity data for some chemicals evaluated in the risk characterization.
- n Lack of toxicity criteria specific for evaluating the dermal route of exposure.

Uncertainties Related to Exposure Pathways Evaluated

Additional areas of uncertainty are in regard to the site-specific exposure pathways selected for quantification. For example, groundwater was evaluated at SMA 4 as a potable source for the future industrial worker. Presently, groundwater is prohibited from being used for such purposes. There is no evidence pointing to a change in the future, at least not for this area. Therefore, evaluating risks to industrial workers who drink and shower with on-site groundwater is likely to be an overly conservative approach, resulting in an overestimation of risk for the future industrial worker.

A second example regarding quantification of exposure pathways is evaluating adolescent trespassers for potential contact with constituents in site surface soil. As a conservative approach, this receptor was evaluated, but it is more likely that this pathway is incomplete. ERP Coke is an extremely secure facility, and the likelihood of a young person entering the site, with the conservative exposure frequencies and durations used in this risk assessment, is low. Hence, even though the risk results demonstrated in this HHRA were not found at unacceptable levels, they are still likely to be overestimated.

Another example regarding quantification of exposure pathways is evaluating exposures to mineral wool. In the absence of an available alternative approach, the intake of mineral wool by receptors was calculated as if the material were soil. The same equations recommended by USEPA to evaluate soil intake were used to calculate mineral wool intake, when it is more likely that less intake would be realized. The nature of the Mineral Wool Pile is such that as it sits exposed to weathering processes, the surface develops a crusty nature, has a vegetative cover which will limit its uptake via ingestion, dermal absorption, and inhalation. However, as a means of evaluating this material, it was treated as if it were soil and intake and risk were calculated for on-site industrial workers and off-site residents. This is a very conservative approach, and although the risk results for these receptors were not found to be an unacceptable levels, it is likely that they are overestimated.

3.7 Preliminary Cleanup Standards

On a media-by-media basis, preliminary cleanup standards (PCSs) were calculated for every individual chemical resulting in an ELCR greater than $1E-06$ or an HQ greater than 0.1 for a receptor demonstrating a site-side cumulative ELCR greater than $1E-04$ or a site-wide cumulative HI greater than 1.0. These chemicals are also known as chemicals of concern (COCs), or risk drivers, as they are the chemicals which would be moved forward to the Corrective Measures Study phase to evaluate alternatives for clean-up to ensure protectiveness. In order to evaluate clean-up strategies, a clean-up level must first be established, hence the need to calculate PCSs for the SMA 4 COCs.

Surface Soil PCSs

PCS calculations showing contributions from ingestion, dermal absorption, and inhalation are presented for the industrial worker exposed to surface soil in Tables B4.1, B4.2, and B4.3, respectively. Surface soil PCSs for carcinogenic effects for industrial workers, derived by the summation of all pathway contributions are presented on Table B4.4. Surface soil PCSs for noncarcinogenic effects for industrial workers, derived by the summation of all pathway contributions are presented on Table B4.5. Both the carcinogenic and noncarcinogenic PCSs for surface soil are summarized on Table 3-22.

Subsurface Soil PCSs

PCS calculations showing contributions from ingestion, dermal absorption, and inhalation are presented for the construction worker exposed to subsurface soil in Tables B4.6, B4.7, and B4.8, respectively. Surface soil PCSs for carcinogenic effects for construction workers, derived by the summation of all pathway contributions are presented on Table B4.9. Surface soil PCSs for noncarcinogenic effects for construction workers, derived by the summation of all pathway contributions are presented on Table B4.10. Both the carcinogenic and noncarcinogenic PCSs for subsurface soil are summarized for construction workers on Table 3-23.

Groundwater PCSs

Groundwater PCSs for potential future industrial workers and construction workers were calculated by using the ratio of a chemical's EPC to the resulting carcinogenic ELCR and noncancer HQ for each COC. This method was employed because of the complexity of the showering pathway for industrial worker and the inhalation of VOCs in a trench by the construction worker. Both the carcinogenic and noncarcinogenic PCSs for groundwater are summarized for industrial workers and construction workers on Table 3-24.

4.0 IDENTIFICATION AND DEVELOPMENT OF PRELIMINARY CLEANUP STANDARDS AND GENERAL RESPONSE ACTIONS

This CMS Report presents the results of the step-by-step evaluation of corrective measure alternatives at SMA 4 under the 2012 AOC. This report reflects the typical CMS format, with Sections 4.0 through 8.0 organized to match the four steps of the CMS process.

This section presents Step 1 of the CMS Process – Development of Preliminary Cleanup Standards (PCSs), Corrective Action Objectives, and General Response Actions. Corrective Action Objectives (CAOs) are medium-specific goals for protecting human health and the environment. Attainment of these goals, which specify the contaminants of concern (COCs), the exposure route(s), and acceptable contaminant levels for each receptor, will result in residual concentrations that are within acceptable levels of risk to human health and the environment. Therefore, the purpose of Step 1, as summarized in this section, is to establish PCSs such that CAOs can be developed and general response actions can be identified for the protection of site receptors from potentially contaminated media at SMA 4.

4.1 Preliminary Cleanup Standards (PCSs) From Human Health Risk Assessment

Medium-specific, as well as chemical-specific PCSs were calculated during the risk assessments developed in Section 3.0 as required by the 2012 AOC. For this CMS, acceptable exposure levels for the contaminants of concern calculated in the risk assessment for SMA 4 (Section 2.0) were used to develop PCSs. The media cleanup goals provide current and long-term considerations to use during analysis and selection of corrective action alternatives (CAAs).

The risk assessment results calculated in Section 3.0 were prepared to calculate cumulative total risk. The cumulative industrial/commercial risk and construction worker risk exceeded an excess lifetime cancer risk (ELCR) $1E-04$ and a hazard index (HI) of 1.0. Therefore, for constituents of concern (COCs) that exceeded an ELCR of $1E-06$ or a HI of 1.0, Preliminary Cleanup Standards (PCSs) were calculated. The PCSs were calculated to levels that would achieve a target risk levels of 10^{-4} , 10^{-5} , and 10^{-6} and target Hazard Indexes of 3, 1, and 0.1 for each COC and are presented in the following sections.

As discussed in the OSWER Directive 9355.0-30 dated April 22, 1991, acceptable risk levels for calculated cumulative carcinogenic risks to an individual based on exposure assumptions can range from 10^{-4} to 10^{-6} as long as the cumulative excess lifetime carcinogen site risk is less than 10^{-4} and the noncancer hazard index (HI) is less than 1. In order to meet the goal of the cumulative ELCR less than 10^{-4} and a HI of 1.0 across all media, the analytical samples from each sample media were screened against the calculated PCSs for the ELCR of 10^{-5} or a HI of 0.1. If multiple

receptors exceeded the ELCR of 10^{-4} and HI of 1.0 for a specific media, then the most conservative PCS value for the 10^{-5} ELCR or 0.1 HI was used to screen the data.

Section 3.0 above determined that risks for all potential receptors other than the industrial and construction worker scenarios fell within EPA's acceptable range; therefore, PCSs were calculated for only the industrial/commercial worker scenario and the construction worker scenario for all completed pathways as appropriate.

4.1.1 Surface Soil PCSs

Surface soil samples were collected from AOC B of SMA 4 during preparation of this CMS and are shown on Figure 2-1. The surface soil samples were collected between 0 - 1 foot below ground surface (bgs) interval in AOC B. These samples were used to calculate the surface soil risk to the receptors. A summary of the analytical data for the surface soil collected in AOC B is included as Table A-1 (Appendix A). The surface soil risk summary based on the exposure assumptions for industrial/commercial workers and construction workers is included as Table 3-15. The COCs are any constituent with an ELCR greater $1E-06$ or an HQ of 0.1. These constituents are summarized below in Table 4-1.

Table 4-1
Risks Summary – Industrial/Commercial Worker,
Assumed Exposure to Surface Soil (0 to 1 foot)
Major Contributors to Total Risk[†] - Summed Over All Exposure Pathways

Chemical	ELCR	HQ
Benzo(a)anthracene	1.6E-06	na
Benzo(a)pyrene	1.7E-05	na
Benzo(b)fluoranthene	2.9E-06	na
Dibenz(a,h)anthracene	5.1E-06	na
Indeno(1,2,3-cd)pyrene	1.4E-06	na
Arsenic	1.0E-05	6.4E-02
Chromium	7.8E-06	1.4E-02

ELCR = Excess Lifetime Cancer Risk

HQ = Hazard Quotient

[†]Chemicals exhibiting ELCRs greater than $1E-06$ and HQs greater than 0.1.

na = not applicable; toxicity factors are not available for these chemicals

EPC = exposure point concentration, the 95%UCL value, mg/kg

PCSs were calculated for the constituents that exceeded an ELCR of 10^{-6} or an HQ of 0.1. The PCSs were calculated for a target risk level of 10^{-4} , 10^{-5} , and 10^{-6} and a target hazard index of 3, 1, and 0.1. The PCSs are shown in Table 4-2 below. In order to meet a cumulative risk level of less than an ELCR of 10^{-4} or a HI of 1.0, the PCS chosen to act as a cleanup trigger level on a domain averaging basis is the most conservative calculated value between the ELCR of 10^{-5} or a HQ of 0.1. The PCSs for the surface soils are highlighted in green.

Table 4-2
Preliminary Cleanup Standards (PCSs) Summary for Surface Soils
 (Units in mg/kg)

Chemical of Concern	Target Risk Level			Target Hazard Index		
	1.0E-04	1.0E-05	1.0E-06	3	1	0.1
<u>Industrial/Commercial Workers</u>						
Benzo(a)anthracene	290	29	2.9			
Benzo(a)pyrene	29	2.9	0.3			
Benzo(b)fluoranthene	290	29	2.9			
Dibenz(a,h)anthracene	29	2.9	0.3			
Indeno (1,2,3-cd)pyrene	291	29	2.9			
Arsenic	194	19	1.9			
Chromium	649	65	6.5			

4.1.2 Subsurface Soil PCSs

Subsurface soil samples collected from SMA 4 during previous investigations are shown on Figure 2-2. The subsurface soil samples included the soil samples collected between 2-15 feet bgs in SMA 4. These samples were used to calculate the subsurface soil risk to the receptors. A summary of the analytical data for the soil collected in SMA 4 is included as Table A-2 (Appendix A). The subsurface soil risk summary based on the exposure assumptions for industrial/commercial worker and construction worker is included as Table 3-16, and they are summarized below in Table 4-3.

Table 4-3
Risks Summary - Construction Workers,
Assumed Exposure to Subsurface Soil (2 to 15 feet)
Major Contributors to Total Risk[†] - Summed Over All Exposure Pathways

Chemical	ELCR	HQ
Benzene	6.0E-07	1.8E-01
Chlorobenzene	na	1.6E-01
Toluene	na	1.2E-01
Benzo(a)pyrene	1.6E-06	na

ELCR = Excess Lifetime Cancer Risk

HQ = Hazard Quotient

[†]Chemicals exhibiting ELCRs greater than 1E-06 and HQs greater than 1.0.

na = not applicable; toxicity factors are not available for these chemicals

EPC = exposure point concentration, the 95%UCL value, mg/kg

Although the ELCR associated with subsurface soils fell within EPA's acceptable range, PCSs were calculated for the constituents that exceeded an ELCR of 10^{-6} or an HQ of 0.1. The PCSs were calculated for a target risk level of 10^{-4} , 10^{-5} , and 10^{-6} and a target hazard index of 3, 1, and 0.1. The PCSs are shown in Table 4-4 below. Since the cumulative HI was less than 1.0, the target HI of 1.0 was used as a cleanup trigger. The PCS chosen to act as a cleanup trigger level on a domain averaging basis is the most conservative calculated value between the ELCR of 10^{-5} or a HQ of 1.0. The PCSs for the subsurface soils are highlighted in green.

Table 4-4
Preliminary Cleanup Standards (PCSs) Summary for Subsurface Soils
(Units in mg/kg)

Chemical of Concern	Target Risk Level			Target Hazard Index		
	1.0E-04	1.0E-05	1.0E-06	3	1	0.1
<u>Construction Workers</u>						
Benzo(a)pyrene	281	28	2.8			
Benzene				1226	409	41
Chlorobenzene				3514	1171	117
Toluene				65355	21785	2179

4.1.3 Mineral Wool Piles PCSs

Samples collected from the SWMU 35 - Mineral Wool Piles in SMA 4 during previous investigations are shown on Figure 2-2. These samples were used to calculate the assumed risk to industrial workers. A summary of the analytical data for the soil collected in SWMU 35 is included as Table A-3 (Appendix A). The Mineral Wool Piles risk summary is included as Table 3-17. None of the COCs had an ELCR greater than 10^{-6} or a HQ greater than 0.1. Therefore PCSs were not calculated for the mineral wool.

4.1.4 Groundwater PCSs

Groundwater samples were collected during previous investigations in SMA 4 (Figure 2-2). A summary of the analytical data for the groundwater collected in SMA 4 is included in Table A-4 (Appendix A). The groundwater risk summary based on the exposure assumptions for industrial/commercial worker and construction worker is included as Table 3-16, and they are summarized below in Table 4-5.

Table 4-5
Risks Summary - Industrial/Commercial Workers and Construction Workers
Assumed Exposure to Groundwater
Risk Summed Over All Exposure Pathways, at each Well
For Chemicals Detected in the Specified Well

Chemical	Industrial/Commercial Worker		Construction Worker	
	ELCR	HQ	ELCR	HQ
Vinyl chloride	2.1E-04	3.8E-01	1.7E-06	2.5E-01
Methylene chloride	6.1E-07	1.6E-01	3.4E-09	3.9E-02
cis-1,2-Dichloroethene	na	2.7E-01	na	8.9E-03
Benzene	1.2E-02	1.4E+02	5.5E-04	1.6E+02
1,2-Dichloroethane	1.4E-04	1.9E+00	6.4E-06	2.4E+00
Trichloroethene	5.1E-07	1.3E-01	1.5E-08	1.3E-01
Toluene	na	2.7E+00	na	8.7E-01
Chlorobenzene	na	1.7E+02	na	2.0E+02
1,4-Dioxane	1.1E-06	1.1E-02	2.5E-09	1.2E-03
1,2,4-Trichlorobenzene	8.4E-06	2.8E+00	2.8E-08	2.8E+00
1,4-Dichlorobenzene	1.6E-04	1.0E-01	7.0E-06	6.0E-02
Pentachlorophenol	4.1E-04	5.7E-01	4.5E-07	1.6E-02
Naphthalene	1.5E-05	4.2E-01	7.0E-07	4.8E-01
Benzo(a)anthracene	1.1E-05	na	1.5E-08	na
Benzo[a]pyrene	8.6E-05	na	1.0E-07	na
Benzo(b)fluoranthene	6.6E-06	na	8.0E-09	na
Dibenz(a,h)anthracene	6.3E-05	na	6.3E-08	na
Indeno[1,2,3-cd]pyrene	1.6E-05	na	1.6E-08	na

ELCR = Excess Lifetime Cancer Risk

HI = Hazard Index

PCSs were calculated for the constituents that exceeded an ELCR of 10⁻⁶ or an HQ of 0.1. The PCSs calculated from the groundwater samples are shown below in Table 4-6. In order to meet a cumulative risk level of less than an ELCR of 10⁻⁴ or a HI of 1.0. The PCS chosen to act as a cleanup trigger on a domain averaging basis is the most conservative calculated value between the ELCR of 10⁻⁵ or a HQ of 0.1. The PCSs for the groundwater samples are highlighted in green.

Table 4-6
Preliminary Cleanup Standards (PCSs) Summary for SMA 4 Groundwater
 (Units in µg/l)

Chemical of Concern	Target Risk Level			Target Hazard Index		
	1.0E-04	1.0E-05	1.0E-06	3	1	0.1
<u>Industrial/Commercial Worker</u>						
Benzene	149	15	1.5	385	128	12
Chlorobenzene				784	261	26
Toluene				15,835	5,278	527
Trichloroethene				28.6	9.54	0.95
Vinyl chloride	37	3.7	0.37	624	208	21
1,2,4-Trichlorobenzene	390	39	3.9	36	12	1.2
1,2-Dichloroethane	54	5.4	0.54	117	39	3.9
Cis-1,2-Dichloroethene				607	202	20.2
1,4-Dichlorobenzene	146	15	1.5			
1,4-Dioxane	170	17	1.7			
Benzo(a)anthracene	0.8	0.08	0.008			
Benzo[a]pyrene	0.05	0.005	0.0005			
Benzo(b)fluoranthene	0.9	0.09	0.009			
Dibenz(a,h)anthracene	0.03	0.003	0.0003			
Indeno[1,2,3-cd]pyrene	0.3	0.003	0.0003			
Methylene chloride				1,641	547	54.7
Naphthalene	51.8	5.18	0.518	54.4	18.1	1.81
Pentachlorophenol	5.1	0.51	0.051	110	36.8	3.7
<u>Construction Worker</u>						
Benzene	3,273	327	33	337	110	11
Chlorobenzene				666	222	22
Trichloroethene				28.6	9.54	0.95
Vinyl chloride	4,660	466	46.6	950	317	31.7
1,2-Dichloroethane	1,172	117	11.7	93.7	31.2	3.12
1,4-Dichlorobenzene	3,274	327	32.7			
1,2,4-Trichlorobenzene				35	12	1.2
Naphthalene				47	16	1.6
Toluene				49,145	16,382	1,638

Groundwater risk for vapor intrusion was also calculated for industrial/commercial workers. The vapor intrusion screening indicates a risk in excess of an ELCR of 10E-04 and a HI of 1.0. However, calculation of PCSs for vapor intrusion is unnecessary because this theoretical risk will be adequately mitigated if the groundwater PCSs set forth in Section 4-7 are achieved. Therefore, additional consideration of onsite vapor intrusion studies is not warranted.

4.1.5 Summary of PCSs

Table 4-7 and 4-8 below lists the summary of the PCSs highlighted in green from the surface soil PCSs from Table 4-3, the subsurface soil from Table 4-5, and the Groundwater PCSs from Table 4-8.

Table 4-7
Preliminary Cleanup Standards (PCSs) Summary
Surface Soil and Subsurface Soil

	Surface Soil		Subsurface Soil	
	ECLR (mg/kg)	HQ (mg/kg)	ECLR (mg/kg)	HQ (mg/kg)
Chemical of Concern	1.0E-05	0.1	1.0E-05	0.1
Benzo(a)anthracene	29			
Benzo(a)pyrene	2.9		28	
Benzene				41
Chlorobenzene				117
Toluene				2179
Benzo(b)fluoranthene	29			
Dibenz(a,h)anthracene	2.9			
Indeno (1,2,3-cd)pyrene	29			
Arsenic	19			
Chromium	65			

The current USEPA MCLs and Tapwater RSLs (if MCL not available) are also included in table 4-9 below. The MCLs are the concentrations required to meet the groundwater restoration goal if the surficial aquifer at the site was determined to be a drinking water source. The MCLs/RSLs that are lower than the calculated PCSs are benzene, benzo(a)anthracene, and indeno(1,2,3)cd-pyrene.

Table 4-8
Preliminary Cleanup Standards (PCSs) Summary
Groundwater

	Groundwater		
	ECLR (ug/L)	HI (ug/L)	MCL/Tapwater RSL (ug/L)
Chemical of Concern	1.0E-05	0.1	
Benzene		11	5
Chlorobenzene		22	100
Toluene		527	1000
Trichloroethene		0.95	5
Vinyl chloride	3.7		2
1,2,4-Trichlorobenzene		1.2	70
1,2-Dichloroethane	5.4		5
Cis-1,2-Dichloroethene		20.2	70

	Groundwater		
	ECLR (ug/L)	HI (ug/L)	MCL/Tapwater RSL (ug/L)
Chemical of Concern	1.0E-05	0.1	
1,4-Dichlorobenzene	15		75
1,4-Dioxane	17		0.46
Benzo(a)anthracene	0.08		0.012
Benzo[a]pyrene	0.005		0.2
Benzo(b)fluoranthene	0.09		0.034
Dibenz(a,h)anthracene	0.003		0.0034
Indeno[1,2,3-cd]pyrene	0.03		0.034
Methylene chloride		54.7	5.0
Naphthalene	5.18		0.17
Pentachlorophenol	0.51		1.0

4.2 Estimated Areas of Affected Media

Based on the results of the previous investigations and the cleanup goals established in the HRRRA risk assessment, approximate areas of affected media at SMA 4 were identified. Areas were calculated based on assumptions as required by the 2012 AOC to be above the PCS established in Section 4.1. However, not all of the estimated media will necessarily be the subject of corrective action because (1) some media do not present an unacceptable risk and (2) any corrective action will be to achieve the media-specific PCS on a domain averaging basis.

4.2.1 Surface Soil

The following PCS were exceeded in the surface soil samples:

- Benzo(a)pyrene – SBB001 and SBB002
- Arsenic – SBB002, SBB003, SBB008

The surface soil COCs above the PCS are presented in Table A-1 and on Figure 4-1.

The cumulative ELCR for SMA 4 was greater than 10^{-4} , and an overall goal of corrective measures at SMA 4 will therefore be to move the cumulative ELCR to within EPA's acceptable risk range of 10^{-4} to 10^{-6} . In light of that, we are of the opinion that the surface soil is not a threat to human health and the environment and is not in need of active remediation. We base this opinion on the following:

- Because of greater relative risks presented by other media, corrective measures on those other media alone are expected to lower the ELCR and HI to EPA's acceptable risk range.
- There is very limited surface soil in SMA 4, and receptors are present in the area where surface soil is present only infrequently.

- The cumulative surface soil ELCR and the HI are in EPA's acceptable ranges.
- In addition, since the completion of the ELCR, EPA released a toxilogical review of benzo(a)pyrene (BaP). Their results indicate that BaP is 7.3 times less potent as an oral carcinogen than previously thought, and is half as potent as an inhalation carcinogen. Therefore, the calculated PCS in surface soil for BaP is extremely conservative.
- The arsenic concentrations at this industrial facility range from 6.7 parts per million (ppm) to 26 ppm. By comparison, the EPA has allowed cleanup values as high as 37.0 ppm in residential soils in the state².

4.2.2 Subsurface Soil

The following PCS were exceeded in the subsurface soil samples:

- Benzene – CM-SB0033
- Chlorobenzene – Not Exceeded
- Toluene –CM-SB0018
- Benzo(a)pyrene – CM-SB0028, CM-SB0050

The subsurface soil COCs above the PCS are presented in Table A-2 and on Figure 4-2. The cumulative ELCR was below 10⁻⁴, and the cumulative HI was less than 1.0.

The subsurface soil was screened against the groundwater protection soil screening levels (GWP SSLs). The GWP SSLs are used to evaluate chemical concentrations in subsurface soil as a means of determining if measured site soil concentrations present a potential threat for future contamination of groundwater. GWP SSLs used for screening of SMA 4 subsurface soil chemical concentrations were derived in the Phase III RCRA Facility Investigation Report (Arcadis & CH2MHill, 2009). If SSLs were not available in the Phase II report, SSLs provided on USEPA's RSL table (Nov. 2015) were used. Chemical screening against groundwater protection SSLs is presented on Table A-2. Of the chemicals with a FOD greater than 5%, the 95% UCL of the mean for the chemicals listed below were found to exceed their respective SSLs in SMA 4 subsurface soil.

- Benzene
- Chlorobenzene
- Toluene
- Vinyl chloride
- 1-Methylnaphthalene
- 3 & 4 Methylphenol
- 4-Methylphenol (p-cresol)

² Pallas, Jeffery T., 2011, "Final Residential Soil Cleanup Values", USEPA Restoration and Underground Storage Tank Branch RCRA Division.

- Benzo(a)anthracene
- Benzo(b)fluoranthene
- Carbazole
- Dibenzofuran
- Naphthalene
- Arsenic

At least one constituent exceeded the groundwater protection soil screening levels (GWP SSL) in each of the following soil samples:

- CM-SB0003 through CM-SB0013;
- CM-SB0015 through CM-SB0027;
- CM-SB0029 through CM-SB0037;
- CM-SB0039;
- CM-SB0040;
- CM-SB0044;
- CM-SB0045;
- CM-SB0047;
- CM-SB0050 through CM-SB0052;
- CM-SB0054;
- CM-SB0055;
- CM-SB0058 through CM-SB0061;
- CM-SB0063;
- 26-SB0001;
- 26-SB0002;
- 27-SB0001;
- 27-SB0002;
- 29-SB0001;
- 29-SB0002;
- 31-SB0001;
- 31-SB0002; and
- MW-53 through MW-55.

The subsurface soil sample locations which have COCs exceeding the GWP SSLs are highlighted on Figure 4-3.

The cumulative ELCR for SMA 4 was greater than 10^{-4} , and an overall goal of corrective measures at SMA 4 will therefore be to move the cumulative ELCR to within EPA's acceptable risk range of 10^{-4} to 10^{-6} . In light of that, we are of the opinion that the subsurface soil concentrations are not a threat to human health or environmental receptors and subsurface soil is not in need of active remediation. We base this opinion on the following:

- Because of greater relative risks presented by other media, corrective measures on those other media alone are expected to lower the ELCR and HI to EPA's acceptable risk range.
- The cumulative subsurface soil ELCR and the HI are in EPA's acceptable ranges.
- In addition, since the completion of the ELCR, EPA released a toxicological review of benzo(a)pyrene (BaP). Their results indicate that BaP is 7.3 times less potent as an oral carcinogen than previously thought, and is half as potent as an inhalation carcinogen. Therefore, the calculated PCS in subsurface soil for BaP is extremely conservative.
- The arsenic concentrations range from 1.5 parts per million (ppm) to 18 ppm in the subsurface soil. The EPA has allowed cleanup values as high as 37.0 ppm in residential soils in the state.

4.2.3 Mineral Wool Piles

Based on the results of the HHRA, no constituents exceeded an ELCR of $10E-6$ or an HQ of 0.1; therefore, PCSs were not calculated. The Mineral Wool Piles do not require or warrant further action and are not affected media. The mineral wool is an end product. ERP Coke will continue to market it as such.

4.2.4 Groundwater

For the chemicals listed below, the PCS was exceeded in the following wells at least once in the last 6 sampling events:

- Benzene – MW-49S, MW-51, MW-54, MW-56, MW-56, MW-81
- Chlorobenzene – MW-54, MW-55, MW-56
- Toluene – MW-49S, MW-54, MW-55, MW-81, MW-89
- Trichloroethene – MW-49S, MW-51, MW-54, MW-55, MW-56, MW-81
- Vinyl Chloride – MW-49S, MW-50, MW-51, MW-52, MW-53
- Cis-1,2-Dichloroethene – MW-49S, MW-51, MW-52, MW-90
- Benzo(a)anthracene – MW-54, MW-56, MW-71
- Benzo(a)pyrene – MW-54, MW-56
- Benzo(b)fluoranthene – MW-54, MW-56, MW-71
- Dibenz(a,h)anthracene – MW-56, MW-71
- Indeno[1,2,3-cd]pyrene – MW-56, MW-71
- Methylene chloride – MW-70, MW-71
- Naphthalene – MW-56, MW-55, MW-56, MW-72, MW-81

The groundwater COCs above the PCS are presented in Table A-4 and on Figure 4-4, and the groundwater COCs above the MCLs are shown on Figure 4-5. The groundwater plume is approximately 550 ft x 800 ft.

4.3 Corrective Action Objectives

The corrective action objectives (CAOs) are medium-specific goals and specify the COCs, the exposure route(s) and receptor(s), and an acceptable contaminant level (i.e., remediation goal). The overall CAOs for SMA 4 are:

- n Protect human health and the environment.
- n Achieve the chemical-specific PCSs for each media, including restoration of groundwater to drinking water standards, if practicable, or other applicable standards.
 - o Selection of cleanup standards also requires the establishment of points of compliance which represents where the media clean up levels are to be achieved; remediation time frame which is the site-specific schedule for a remedy) including both time frame to construct the remedy and estimate of the time frame to achieve the cleanup levels at the point of compliance).
- n Control the source(s) of release so as to reduce or eliminate, to the extent practicable, further releases of hazardous waste or hazardous constituents that may pose a threat to human health and the environment.
- n Comply with any applicable waste management standards.

4.3.1 Commercial/Industrial Worker

The cumulative risks across all media exceed an ELCR of 10E-04 and a HI of 1.0. The groundwater is the predominant factor in the exceedance of the cumulative risk.

4.3.2 Construction Worker

The cumulative risks across all media exceed an ELCR of 10E-04 and a HI of 1.0. The groundwater is the predominant factor in the exceedance of the cumulative risk. In addition, the HI in subsurface soil for a construction worker is 1.2 which is slightly greater than a HI of 1.0

4.4 General Response Actions

General response actions describe those actions that will satisfy the CAOs for all media. General response actions were considered for evaluation based on their adequacy to address affected media exceeding the PCSs. The response actions identified for this CMS are listed below and described in the subsequent sections.

- n No Action
- n Institutional Actions
- n Containment
- n Treatment
- n Removal and Disposal

4.4.1 No Action

The No Action response establishes a baseline for alternative comparison. A no action alternative can include limited environmental monitoring to assess the impacts associated with no remedial actions, but cannot include actions to minimize risk by reducing either contaminant exposure pathways or contamination through treatment. The No Action response action proposed for this site would not include any environmental monitoring, remedial activity, or land use restrictions.

4.4.2 Institutional Controls

Institutional controls consist of land use controls including any type of physical, legal, or administrative mechanism that restricts use of or limits access to real property to prevent or reduce risks to human health and the environment. Physical mechanisms encompass a variety of remedies to contain or reduce contamination and may include physical barriers intended to limit access to property, such as fences or signs. Legal mechanisms include restrictive covenants, equitable servitudes, and deed notices. Administrative mechanisms include notices and construction permitting or land use management systems that may be used to ensure compliance with use restrictions. The legal mechanisms used for land use controls are generally imposed to ensure that restrictions on land use developed as part of an action remain in place.

4.4.3 Containment

The containment response action employs a barrier to limit the mobility of a constituent and/or prevent direct contact with the constituent.

4.4.4 Removal

Removal involves the excavation or extraction of affected media. The affected media will then be treated or disposed.

4.4.4.1 Treatment

Treatment of removed media involves the isolation of hazardous constituents from the media. Treatment will be evaluated as a means to reduce concentrations to acceptable levels or to create conditions that will limit or restrict constituent mobilization. The result is a reduction of the toxicity, mobility, or volume.

4.4.4.2 Disposal

Disposal of removed material involves the transport of media to an appropriate permitted off-site disposal facility. Disposal will be evaluated as a means to remove the hazardous material from the site for appropriate disposal.

5.0 IDENTIFICATION AND SCREENING OF TECHNOLOGIES AND PROCESS OPTIONS

This section describes the identification and screening of potentially applicable corrective action technologies and process options for each general response action described in Section 3.0 that may be applied to reduce and/or eliminate exposure to affected media at SMA 4. Screening potential technologies is an optional step and not required in the CMS process according to the Corrective Measures Study Scope of Work located at the website <http://www.epa.gov/reg3wcmd/pdf/chev6.pdf> referenced in Paragraph 29 of the AOC.

The identification of technologies for this CMS has been focused on realistic remedies that will achieve the corrective action objectives (see Section 3.3) for soil and groundwater at the site. USEPA presumptive remedies <http://www.epa.gov/oerrpage/superfund/policy/remedy/presump/pol.htm> was reviewed and used to streamline the identification process. Process options that represented the full spectrum of options for each technology were then identified so that a technology would not be eliminated during the screening process because of an overly narrow choice of process options.

The selection of corrective action technologies and process options to be considered for screening was based solely on technological limitations with respect to the unsuitability for the COCs identified in the media at SMA 4, the magnitude of COC concentrations, the characteristics of the materials, the distribution and location of the waste materials, and site-specific conditions such as topography and hydrogeologic characteristics (USEPA, 1994). The selected technologies and process options were then evaluated in terms of: effectiveness; reduction of toxicity, mobility, or volume of waste; implementability; and cost (with particular emphasis on effectiveness) using a *High*, *Medium*, and *Low* benefit rating system. A description of the screening criteria is presented below:

- n Effectiveness – The effectiveness of a given process option was determined based on its ability to remediate the estimated volume of contaminated media and meet the cleanup levels listed in the CAOs. A *High* ranking indicates that the technology would be very effective.
- n Reduction of toxicity, mobility, or volume of waste; implementability – The effectiveness of a given process option are based on the ability to destroy, remove, or degrade the existing contamination.
- n Implementability – The ease or difficulty to implement the process option was evaluated in terms of the technical and administrative issues. A *High* ranking indicates that the technology would be easy to implement.

- n Cost – A qualitative cost estimate of the process options was evaluated relative to the other process options under evaluation. The costs considered include capital costs and operation and maintenance costs. A *High* ranking indicates that the technology would be relatively inexpensive to implement when compared to the other technologies.

A description of each potentially applicable technology type and associated process options relative to soils, sediment, and groundwater are presented in the following subsections.

5.1 Surface and Subsurface Soil

5.1.1 No Action

The No Action response assumes that no additional source control measures will be implemented and no monitoring will be performed. As a result, no technologies or process options have been identified for the No Action response. No Action has been retained for further consideration as a corrective measures technology to serve as a basis of comparison.

5.1.2 Land Use Controls

The corrective measures technology identified for the institutional controls response is Land Use Controls. Land Use Controls consists of physical, legal, and administrative mechanisms to restrict the use of or limit access to affected areas of the site to protect current and future receptors.

Given that the proposed remedies for each of the SMAs rely on a LUCP, it is anticipated that EPA's final remedy proposal will require an Environmental Covenant pursuant to the Alabama Uniform Environmental Covenants Act, Code of Alabama 1975, §§35-19-1 to 35-19-14. Such covenants are necessary if the final remedy places a land use control at a facility because it is not being remediated to unrestricted use.

5.1.2.1 Physical Barriers

Physical barriers are mechanisms used to protect human health and the environment from exposure to the on-site sediments/soils, including fences and warning signs that would limit access to affected areas of the site. Fences could be erected around affected areas of the site and signs or permanent markers could be posted at the boundaries of affected areas of the site to warn current and future receptors of the remaining constituents and potential exposure. Each of these corrective action technologies is technologically feasible and has been retained for further consideration as a corrective measure alternative.

5.1.2.2 Legal Barriers

Legal barriers include restrictive covenants and deed notices. Each of these process options is technologically feasible and has been retained for further consideration as a corrective measures technology.

5.1.2.3 Administrative Barriers

Administrative barriers could include (1) a land use control plan (LUCP) to notify and restrict current receptors from accessing affected areas of the site and (2) development or use of construction permitting (e.g., digging permits) or restrictions to protect future receptors. These mechanisms have been retained for further consideration as corrective action technologies.

5.1.3 Treatment

Treatment technologies identified for subsurface soil remediation at this site are biological and physical processes.

5.1.3.1 Biological Treatment

Biological treatment technologies typically use naturally occurring bacteria to break down constituents into simpler, more benign substances. Bioremediation technologies often encourage contaminant degradation by enhancing site conditions such as oxygen availability, water, nutrients, and microorganisms. Three *in-situ* process options identified included bioreclamation, natural attenuation, and phytoremediation. Biological treatment was retained for evaluation as a corrective measures technology.

5.1.3.2 Chemical Treatment

Chemical treatment (e.g., chemical oxidation) involves using chemical reactions to transform organic compounds into more benign substances. Chemical treatment may include injection of chemicals such as ozone, peroxide, or other oxidizers. Chemical treatment was retained for evaluation as a corrective measures technology.

5.1.3.3 Physical Removal and Treatment

Physical treatment includes process options that separate or stabilize constituents in soil to prevent migration by various physical methods. These processes were eliminated from further consideration due to implementation difficulties associated with remediation of non-homogenous media in the field and their lack of long term reliability.

5.1.4 Summary Screening Technologies Retained for Soil Remediation

The following technologies were retained for further consideration for soil remediation:

- n No Action
- n Physical Barriers
- n Legal Barriers
- n Administrative Barriers
- n Treatment

5.2 Groundwater

5.2.1 No Action

The No Action response assumes that no additional control measures will be implemented and no monitoring will be performed. As a result, no technologies or process options have been identified for the No Action response. Because some SWMUs have no identified groundwater contamination, No Action has been retained for further consideration as a corrective measures technology to serve as a basis of comparison between the existing and proposed control and/or groundwater treatment for the site.

5.2.2 Institutional Controls

The technologies identified for the Institutional Controls response includes Land Use Controls and Monitoring.

5.2.2.1 Land Use Controls

The corrective measures technology identified for the institutional controls response is Land Use Controls. Land Use Controls consists of physical, legal, and administrative mechanisms to restrict the use of or limit access to affected areas of the site to protect current and future receptors.

Given that the proposed remedies for each of the SMAs rely on a LUCP, it is anticipated that EPA's final remedy proposal will require an Environmental Covenant pursuant to the Alabama Uniform Environmental Covenants Act, Code of Alabama 1975, §§35-19-1 to 35-19-14. Such covenants are necessary if the final remedy places a land use control at a facility because it is not being remediated to unrestricted use.

5.2.2.2 Monitoring

The monitoring technology includes the long-term monitoring and monitored natural attenuation process options. These options provide for the collection and analysis of periodic groundwater

samples to monitor the concentration and/or degradation of constituents within groundwater. The long-term groundwater monitoring technology has been retained for further consideration as a corrective measures technology.

5.2.3 Containment

Potential containment technologies include the construction of horizontal or vertical barriers to “contain” or limit potential migration of groundwater. The containment technology identified for this site is a soil or asphalt/concrete cap/cover, which would significantly reduce the amount of infiltration of surface water through the affected soil. This process option has been retained for further consideration as a corrective measures technology.

5.2.4 Treatment

Treatment technologies identified for groundwater remediation at this site are biological, thermal and physical processes.

5.2.4.1 Biological Treatment

Biological treatment technologies typically use naturally occurring bacteria to break down constituents into simpler, more benign substances. Bioremediation technologies often encourage contaminant degradation by enhancing site conditions such as oxygen availability, water, nutrients, and microorganisms. Three *in-situ* process options identified included bioreclamation, natural attenuation, and phytoremediation. The process effective for remediation of organic contaminants (e.g., BaP) is typically not effective for the remediation of inorganic contaminants (e.g., metals). Therefore, biological treatment was not retained for further evaluation.

5.2.4.2 Thermal Treatment

Thermal treatment uses controlled high-temperature environments to oxidize organic compounds to produce carbon dioxide and water. Thermally enhanced groundwater vapor extraction was the process option identified for use to treat volatile and semi-volatile contaminated groundwater; however, due to logistics and costs, and this method being ineffective on inorganic contaminants, thermally enhanced groundwater vapor extraction was not retained for evaluation as a corrective measures technology.

5.2.4.3 Chemical Treatment

Chemical treatment (e.g., chemical oxidation) involves using chemical reactions to transform organic compounds into more benign substances. Chemical treatment may include injection of chemicals such as ozone, peroxide, or other oxidizers. Chemical treatment was retained for evaluation as a corrective measures technology.

5.2.4.4 Physical Removal and Treatment

Physical treatment includes process options that separate or stabilize constituents in groundwater to prevent migration by various physical methods. These processes were eliminated from further consideration due to implementation difficulties associated with remediation of non-homogenous media in the field and their lack of long term reliability.

In addition, hydraulic control of groundwater by using electrical or pneumatic pumps is a physical process. Once the groundwater is removed, chemical processes would be used to remove any contaminants from the groundwater. Treatment of recovered groundwater would be accomplished using the process water treatment system which eventually uses the existing BTF for final treatment. This treatment option has been retained for further consideration as a corrective measures technology.

5.2.5 Summary Screening Technologies Retained for Groundwater Remediation

The following technologies were retained for further consideration for groundwater remediation:

- n No Action
- n Physical Barriers
- n Legal Barriers
- n Administrative Barriers
- n Long Term Groundwater Monitoring
- n Treatment
- n Physical Removal and Treatment

6.0 DEVELOPMENT OF CORRECTIVE ACTION ALTERNATIVES

Potential remedies for addressing contamination in site media are developed by assembling combinations of corrective measure technologies screened in Section 4.0 in order to meet the CAOs. Once Corrective Action Alternatives are developed, the alternatives will be compared against one another in Section 6.0. The Corrective Action Alternative chosen for the site will be recommended and justified in Section 7.0.

6.1 Corrective Measure Technology Screening

The corrective measure technologies (CMT) remaining from the screening process (Section 4.0) have been combined in this section to develop corrective action alternatives (CAA) for sediment, soil, and groundwater that meet the CAOs for SMA 4. The CMT and process options to be evaluated are listed in the table below:

Table 6-1
List of Corrective Measure Technologies and Process Options

No.	General Response Action	Corrective Measure Technology	Process Options
CMT1	No Action	None	None
CMT2	Institutional Actions	Land Use Controls	Physical Barriers (Fence/Signs)
CMT3	Institutional Actions	Land Use Controls	Legal Barriers
CMT4	Institutional Actions	Land Use Controls	Administrative Barriers
CMT5	Institutional Actions	Sampling or Monitoring	Soil Sampling or Groundwater LTM
CMT6	Containment	Capping	Soil Cap/Asphalt or Concrete Cover
CMT7	Treatment	Chemical Treatment	In-Situ Injection for Soil and/or Groundwater
CMT8	Removal and Disposal	Excavation	Targeted Soil Removal

CMT=Corrective Measure Technology

The CMTs listed in the above table were evaluated individually for each media and each exposure pathway in terms of satisfying the components of the CAOs developed for the site. If the implementation of a given CMT would result in the partial attainment of the CAOs for that media in tables 5-2 and 5-3, then it was assigned a yes and selected as a corrective measure technology. When all of the individual media and exposure pathways had been assessed individually, then the individual CMTs were combined to form CAAs that are presented in Table 5-4.

Table 6-2
Evaluation and Screening of Potential
Corrective Measure Technologies for Subsurface Soil

No.	General Response Action	Corrective Action Technology (Process Option)	Subsurface Soil	
			Satisfy CAO for Construction Worker?	Satisfy CAO for Industrial Worker?
CMT1	No Action	None	NO	NO
CMT2	Institutional Actions	Physical Barriers (Fence/Signs)	YES	YES
CMT3	Institutional Actions	Legal Barriers	YES	YES
CMT4	Institutional Actions	Administrative Barriers	YES	YES
CMT5	Containment	Soil Cap or Asphalt/Concrete Cover	NA	NA
CMT6	Treatment	In-Situ Injection	NA	NA
CMT7	Removal and Disposal	Targeted Excavation and Disposal	NA	NA

CMT=Corrective Measure Technology

NA = Not Applicable since the PCSs in subsurface soil were not exceeded.

Based on the results of the evaluation as summarized in Table 5-2, the following CMTs met the requirements of the set of CAOs for subsurface soil in SMA 4 and were selected to be combined with other media remedial options to form corrective action alternatives:

CMT1: No Action (to serve as a baseline)
 CMT2 + CMT3 + CMT4: Land Use Controls (Administrative and Physical)

Table 6-3
Evaluation and Screening of Potential
Corrective Measure Technologies for Groundwater

No.	General Response Action	Corrective Action Technology (Process Option)	Groundwater	
			Satisfy CAO for Construction Worker?	Satisfy CAO for Industrial Worker?
CMT1	No Action	None	NO	NO
CMT2	Institutional Actions	Physical Barriers (Fence/Signs)	YES	YES
CMT3	Institutional Actions	Legal Barriers	YES	YES
CMT4	Institutional Actions	Administrative Barriers	YES	YES
CMT5	Institutional Actions	Groundwater Long Term Monitoring	YES	YES
CMT6	Chemical Treatment	In-Situ Injection	YES	YES
CMT7	Physical Removal and Treatment	Groundwater Pumping and Treatment	YES	YES

CMT=Corrective Measure Technology

Based on the results of the evaluation as summarized in Table 5-3, the following CMTs met the requirements of the set of CAOs for groundwater in SMA 4 and were selected to be combined with other media remedial options to form CAAs:

CMT1:	No Action (to serve as a baseline)
CMT2 + CMT3 + CMT4:	Land Use Controls (Administrative and Physical)
CMT5:	Groundwater Long Term Monitoring (LTM)
CMT6:	Chemical Treatment
CMT7:	Physical Removal and Treatment

6.2 Corrective Action Alternatives

The corrective action alternatives selected for SMA 4 were intended to represent a broad spectrum of remedial options, ranging from alternatives such as land use controls that prevent or control exposure to active alternatives that employ treatment to reduce toxicity, mobility, or volume.

A total of five corrective action alternatives have been developed by combining the corrective measure technologies screened in Section 5.1 to satisfy the CAOs for the contaminated media present in SMA 4. Parameters specific to SMA 4, including the variation of site activities and areas of exposure associated with the industrial worker and construction worker scenarios, allowed for adequate differentiation among the six alternatives with respect to effectiveness, implementability, and cost. Although groundwater monitoring is not a corrective measure technology that will satisfy the CAOs, it is used in conjunction with other groundwater remedial options to determine the effectiveness of those remedial options as they are implemented. The corrective action alternatives (CAA) for the site are listed below:

- n CAA 1 No Action
- n CAA 2 Physical , Legal , and Administrative Barriers (Land Use Controls)
- n CAA 3 Land Use Controls + Groundwater LTM
- n CAA 4 Land Use Controls + In-Situ Soil Source Area Treatment + In-Situ Groundwater Treatment + Groundwater Monitoring
- n CAA 5 Land Use Controls + In-Situ Soil Source Area Treatment + Groundwater Removal and Treatment + Groundwater Monitoring

Additional components of these alternatives with respect to the impacted media at the site are listed in the table below:

Table 6-4
Components of the Multi-Media Corrective Action Alternatives

<i>Components</i>	<i>Corrective Action Alternatives</i>				
	1	2	3	4	5
Soil/Sediment					
<i>No Action</i>	..				
<i>Land Use Controls</i>	
Groundwater					
<i>No Action</i>	..				
<i>Land Use Controls</i>	
<i>Groundwater LTM</i>		

Components	Corrective Action Alternatives				
	1	2	3	4	5
<i>Chemical Treatment</i>			
<i>Physical Removal and Treatment</i>					..

A detailed description of each alternative is provided in the subsections below.

6.2.1 CAA 1—No Action

The No Action corrective action alternative assumes that no further remedial action will occur at SMA 4 and has been included to establish a baseline for alternative comparison. Alternative 1 can include limited environmental monitoring to assess the impacts associated with no remedial response action, but cannot include actions to minimize risk by reducing either contaminant exposure pathway or contamination through treatment.

6.2.2 CAA 2— Physical , Legal , and Administrative Barriers (Land Use Controls)

The Physical Barrier, Legal Barrier, and Administrative Barrier (Institutional Control) alternatives consist of administrative and physical mechanisms to place restrictions on the use of and limit access to the site and/or SWMUs/AOCs to prevent exposure to site contaminants. SMA 4 is completely fenced, and the facility is manned twenty-four hours a day 365 days a year.

Applying land use controls at SMA 4 will maintain the site as industrial going forward to:

- prevent the site from becoming a future unrestricted residential land use scenario (i.e., to keep the land use industrial).
- be consistent with land use controls proposed to address conditions at the other 4 SMAs at the facility.
- be protective of higher levels of contamination, if any, that may not have been detected by sampling within 4.
- be conservative and protective down to one order of magnitude below the recommended cancer risk level.

A LUCP would be prepared according to USEPA guidance developed in 2012 (<http://www.epa.gov/superfund/policy/ic/guide/index.htm>). The LUCP would identify the objective of the controls to restrict activities within the SMA 4 boundary, list the actions necessary to achieve the objective, and warn potential human receptors of the contaminants at the site. The LUCP is intended to protect current and future receptors and consists of physical, legal, and administrative land use controls. The LUCP would include the following information:

- n A description of the land along with the certified land survey location of the boundary with respect to state plane coordinates,
- n Placing a deed restriction on the property to limit the site to industrial/commercial land use.
- n Placing a deed restriction on the property to limit the use of groundwater.
- n An explanation of the land use control including permits to perform any digging activities and the proper personal protective equipment (PPE) that must be used to protect workers, and the use of a fence and signs as necessary to prevent unauthorized access,
- n Identification of the facility program point-of-contact designated responsible for implementing the LUCP,
- n An on-site compliance monitoring program,
- n Notification procedures to USEPA and ADEM whenever the facility anticipates a major change in land use,
- n An annual field inspection and report submitted to USEPA and ADEM to document the effectiveness of the land use controls,
- n A certification of the annual report by the designated official to continue compliance with the LUCP,
- n A procedure to notify USEPA and ADEM immediately upon discovery of any unauthorized major change in land use or any activity inconsistent with the LUCP and the actions that would be implemented to ensure protectiveness, and
- n A procedure to provide advance notification to EPA and ADEM of impending transfer, by sale or lease, of SMA 4.

6.2.3 CAA 3 — Land Use Controls + Groundwater Monitoring

The *Land Use Controls and Groundwater Monitoring* alternative consists of a combination of technologies including administrative land use controls and long term groundwater monitoring. This alternative would meet the corrective measure objectives by monitoring the affected site groundwater to ensure the apparent groundwater plume (AOC D) dynamics are acceptable and implementing a LUCP to protect future receptors in the unlikely event the land use changes.

6.2.3.1 Land Use Controls

The Land Use Control that would be implemented in conjunction with the groundwater monitoring would be a LUCP as described in Section 5.2. The LUCP is intended to protect current and future receptors and consists of physical, legal, and administrative land use controls.

6.2.3.2 Groundwater Monitoring

A plume of groundwater containing VOCs has been identified in SMA 4. Historic groundwater monitoring results have shown that the plume had extended to just off of the site to the east but operation of the interim measure has drawn the plume back toward the facility significantly. The plume has been defined. A long-term groundwater monitoring program would be developed to monitor the effectiveness of the selected corrective action.

6.2.4 CAA 4 — Land Use Controls + In-Situ Soil Source Area Treatment + In-Situ Groundwater Treatment + Groundwater Monitoring

The *Land Use Controls, In-Situ Soil Source Area Treatment, In-Site Groundwater Treatment, and Groundwater Monitoring* alternative consists of a combination of technologies including administrative land use controls, in-situ injection for treating subsurface soil and groundwater, and groundwater monitoring. This alternative would meet the corrective measure objectives by reducing and/or eliminating exposure to the affected site media (see Section 3.3) through injection of bacteria or chemicals to remove contaminants in the soil source areas and groundwater; and the development and implementation of a LUCP to protect theoretically possible future receptors in the unlikely event the land use changes. In addition, a long-term groundwater monitoring program will be developed to monitor the effectiveness of the selected corrective action.

6.2.4.1 Land Use Controls

The Land Use Control that would be implemented in conjunction with the groundwater monitoring would be a LUCP as described in Section 6.2.2. The LUCP is intended to work in conjunction with the treatment of soil and groundwater to prevent exposure to contaminated media during the remediation process.

6.2.4.2 In-situ Treatment

Soil source areas and groundwater containing various constituents are present in SMA 4: The soil source area and groundwater plume could be treated in-situ with various types of chemicals or bacteria. If the alternative is chosen, bench scale studies would be conducted to determine the appropriate chemicals or bacteria to be used. In-situ treatment may:

- Reduce concentrations to below the established PCSs to the extent practicable, and
- Function with minimum maintenance.

6.2.4.3 Groundwater Monitoring

A long-term groundwater monitoring program would be developed to monitor the effectiveness of the in-situ groundwater treatment.

6.2.5 CAA 5 — Land Use Controls + In-Situ Soil Source Area Treatment + Groundwater Removal and Treatment + Groundwater Monitoring

The *Land Use Controls, In-Situ Soil Source Area Treatment, Groundwater Removal and Treatment, and Groundwater Monitoring* alternative consists of a combination of technologies including administrative land use controls, in-situ injection for treating soil source area (including ancillary benefit to groundwater), hydraulic control and groundwater treatment, and groundwater monitoring. The groundwater plume identified in SMA 4 (AOC D) would be pumped to gain hydraulic control of the plume and to remove contaminants. The water removed from the plume would be used as process water and treated in the plants light oil process stream. The pumping would serve as a hydraulic control to control, and potentially reverse, migration of the plume, and a means for recovering and treating the plume. A long-term groundwater monitoring program will be developed to monitor the effectiveness of the selected corrective action.

6.2.5.1 Land Use Controls

The Land Use Control that would be implemented in conjunction with the groundwater monitoring would be a LUCP as described in Section 5.2. The LUCP is intended to work in conjunction with the treatment of soil and groundwater to prevent exposure to contaminated media during the remediation process.

6.2.5.2 In-situ Soil Source Area Treatment

Soil source areas containing various constituents are present in SMA 4: The soil source areas could be treated in-situ with various types of chemicals or bacteria. If the alternative is chosen, bench scale studies would be conducted to determine the appropriate chemicals or bacteria to be used. In-situ treatment may reduce soil concentration in the source areas to below the established PCSs and GWP SSLs. In addition, groundwater will also be treated as an ancillary benefit of the treatment of the soil source areas. This will also help to reduce contaminant mass within the groundwater plume, in addition to the removal and treatment described below.

6.2.5.3 Groundwater Removal and Treatment

In addition to the in-situ source area treatment, groundwater hydraulic control wells would be installed in SMA 4 in order to contain the plume associated with AOC D and to reduce the size of the plume. The hydraulic control system will also aid in moving bacteria/chemicals injected in association with soil source areas treatment toward the hydraulic control wells located on the

periphery of the groundwater plume. This will increase the treatment area of the bacteria/chemicals injected in the source areas. The hydraulic control well network will be designed to control the entire plume. The water removed from the plume would be used as process water and treated in the plants light oil process stream. The process water eventually is treated at the ERP Coke Biological Treatment Facility (BTF).

6.2.5.4 Groundwater Monitoring

A groundwater monitoring program as described in Alternative 3 in Section 5.2.3.2 would be used to ensure that the apparent plume does not migrate beyond the facility boundary and determine the effectiveness of the groundwater removal and treatment.

7.0 EVALUATION OF THE CORRECTIVE ACTION ALTERNATIVES

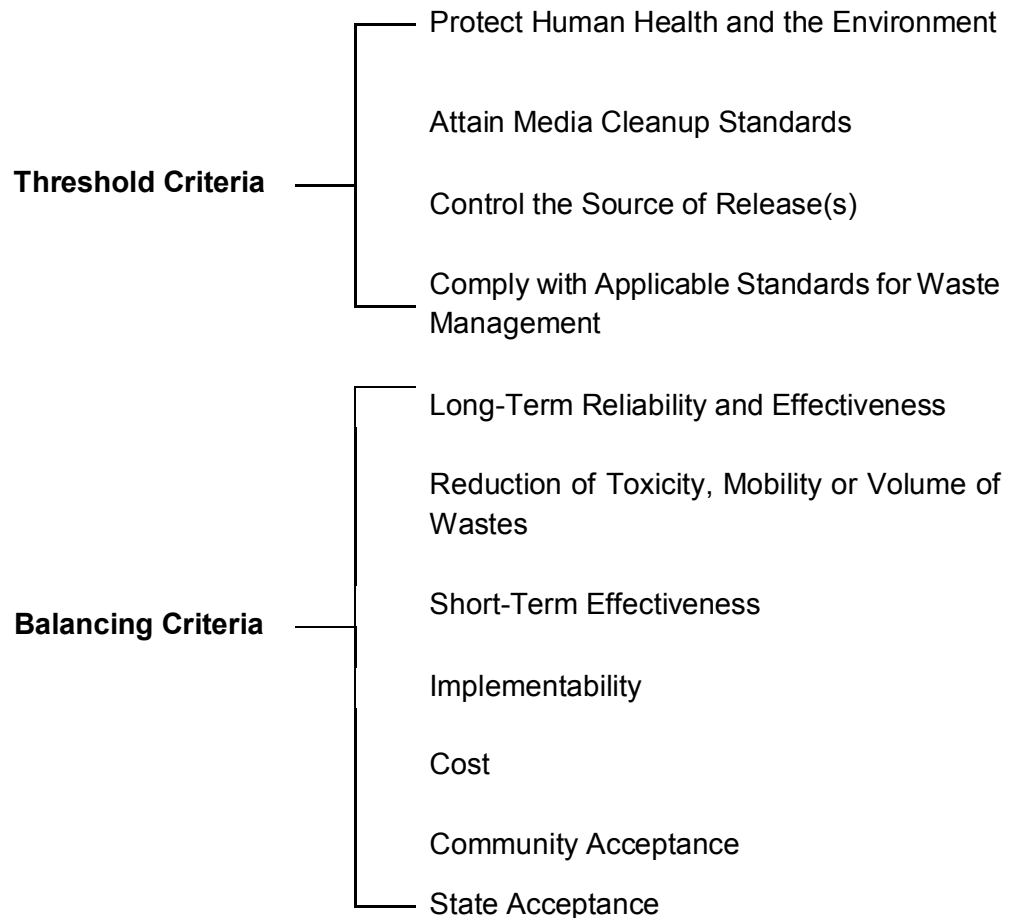

The purpose of the detailed analysis is to provide risk managers with a baseline for evaluating alternatives and selecting the appropriate site remedy. A typical detailed analysis consists of the following components:

- An assessment and summary profile of each alternative individually against the evaluation criteria.
- A comparative analysis among the alternatives to assess the relative performance of each alternative with respect to each evaluation criterion.

This section presents a detailed analysis of the corrective measure alternatives proposed for SMA 4 and summarizes the degree to which each alternative will comply with the requirements of the evaluation criteria.

7.1 Evaluation Criteria

To assist in the evaluation of five corrective action alternatives (CAA) developed for this site, nine of the eleven evaluation criteria presented in the Advanced Notice of Proposed Rulemaking (ANPR), *Corrective Action for Solid Waste Management Units at Hazardous Waste Management Facilities* (USEPA 1996) were used to assess, weigh, and rank the proposed alternatives. As described in the USEPA guidance, the criteria are separated into two groups - threshold criteria and balancing criteria, as summarized below:

7.1.1 Threshold Criteria

The four threshold criteria are described below:

- ***Protect Human Health and the Environment:*** Alternatives are evaluated to determine if implementation will provide and maintain adequate protection of human health and the environment by eliminating, reducing, or controlling site exposures to acceptable risk levels established in the corrective action objectives.
- ***Attain Media Cleanup Standards:*** Alternatives are evaluated to determine if their implementation would result in the attainment of media cleanup standards derived from existing state or federal regulations, as well as site-specific PCSs. In addition, the time frame necessary for the alternative to meet the standards is included.

- n **Control the Source of Releases:** Alternatives are evaluated to determine if their implementation would control or eliminate current and future releases (to the extent possible) that may pose a threat to human health and the environment.
- n **Comply with Applicable Standards for Waste Management:** Alternatives are evaluated to determine if waste management activities associated with the implementation of each alternative would be conducted in compliance with all applicable state or federal regulations.

7.1.2 Balancing Criteria

The five balancing criteria are described below:

- n **Long-Term Reliability and Effectiveness:** Alternatives are evaluated with respect to their demonstrated and expected reliability and permanence based on the degree of certainty that the alternative would prove to be successful in establishing controls to eliminate or manage the risk posed by treatment residuals and/or untreated wastes. Each alternative is also evaluated in terms of its projected useful life (i.e., the length of time the level of effectiveness can be maintained).
- n **Reduction of Toxicity, Mobility, or Volume of Wastes:** Alternatives are evaluated to determine the degree to which their implementation would reduce or eliminate the toxicity, mobility, or volume of waste at the site. This evaluation focuses on specific factors, including the amount of hazardous materials that will be destroyed or treated, the expected reduction of the toxicity, mobility, and volume, the degree to which the treatment will be irreversible, and the type and quantity of treatment residuals.
- n **Short-Term Effectiveness:** Alternatives are evaluated with respect to the short-term risks that might be posed to the community, workers, and the environment during the construction and implementation of the alternative. Each alternative is also evaluated in terms of the time that site conditions are protective of human health and the environment.
- n **Implementability:** Alternatives are evaluated in terms of the ease or difficulty of their implementation considering the technical and administrative feasibility. Technical feasibility includes difficulties and unknowns associated with constructability, time for implementation, time for beneficial results, and availability of technologies, as well as the availability of adequate off-site treatment, storage capacity, disposal services, and technical services and materials. Administrative feasibility includes permits, rights of way, and off-site approvals and the length of time necessary to obtain any approvals.
- n **Cost:** Alternatives are evaluated in terms of the net present value of capital costs and the present worth of the annual operation and maintenance costs. Capital costs consist of

direct costs and indirect costs. Direct costs include labor, equipment, and materials expenditures necessary to install the corrective measure. Indirect costs include engineering, financial, and other service fees apart from installation activities. Cost analyses for the corrective action alternatives are derived from a number of sources, including vendor estimates, estimates from similar projects, actual experience at other sites, and standard costing guidance references. With respect to CERCLA, remedial action alternatives requiring perpetual care are limited to thirty years (USEPA, 2000). This same limitation will be used for costing the corrective action alternatives presented in this document.

- n **Community Acceptance:** The final CMS will be placed on public notice. The public will then be able to comment on the proposed remedies. This balancing criteria will not be addressed further in this document since EPA will take this criteria into account during the public notice process for the Statement of Basis.
- n **State Acceptance:** EPA will evaluate the remedies based on the degree to which they are acceptable to the State of Alabama in which the subject facility is located. This is particularly important where EPA, not the State, selects the remedy. This balancing criteria will not be addressed further in this document since EPA will take this criteria into account during the public notice process for the Statement of Basis.

7.2 Individual Analysis of the CAAs

This section consists of the evaluation of the relative performance of each of the five alternatives selected for SMA 4 individually in terms of the four threshold criteria described above. Several questions are asked for each of the four threshold criteria. The threshold criteria must be met for each remedy under consideration in order for it to move forward for additional consideration. The threshold criteria are scored either yes, no, or not applicable (NA). The NA response would also be a positive answer for the threshold criteria.

The SWMUs and AOCs potentially subject to corrective action in SMA 4 are grouped as follows:

- Surface Soil – AOC B
- Subsurface Soil – SWMU 26, SWMU 27, SWMU 28, SWMU 29, SWMU 30, SWMU 31, SWMU 32, SWMU 33, SWMU 34, SWMU 42
- Groundwater – AOC D

Surface soil contamination is deemed not to warrant active remediation based on the results of the HHRA. Therefore, surface soil is only applicable to the LUCP portion of the CAAs since the HHRA only considered industrial/commercial land use risks.

Risks to human health from subsurface soil contamination are also not considered to warrant active remediation based on the results of the HHRA. However, the potential leaching of some constituents from soil to groundwater was noted. Therefore, subsurface soil source areas containing relatively higher concentrations of these constituents would be subject to treatment in some of the CAAs to address this apparent leaching potential.

Groundwater contamination is considered to need active remediation based on the results of the HHRA for the construction worker and industrial worker scenarios. The CAAs have been prepared to compare alternatives to most effectively remediate the groundwater.

7.2.1 CAA 1 — No Action

Under CAA 1, no action would be taken to mitigate or remediate conditions at the site or control exposure of receptors to the contaminated media. Therefore, the site would remain as it currently exists. The detailed analysis of CAA 1 with respect to the four threshold criteria is described in detail below and summarized in Table 7-1.

CAA 1 - Protect Human Health and the Environment: The environment is protected since there are no ecological receptors in SMA 4. However, the No Action alternative may not achieve the USEPA *de minimis* risk range of 1E-04 to 1E-06 for residential use because this SMA was assessed primarily for industrial and construction scenarios. However, contamination at levels exceeding residential risk screening levels has been detected. Although residential use is unanticipated, no institutional controls would be taken under Alternative 1 to ensure that the land use remains industrial. Based on the information above, the implementation of this alternative would not meet the requirements of this threshold criterion.

CAA 1 - Attain Media Cleanup Standards: The risks assessed for this SMA were for industrial and construction scenarios. However, contamination at levels exceeding residential risk screening levels has been detected. Although residential use is unanticipated, no institutional controls would be taken under Alternative 1 to ensure that the land use remains industrial. Therefore, the implementation of this alternative would not meet the requirements of this threshold criterion.

CAA 1 - Control the Source of Releases: Because there are affected media that have not been capped, removed, or contained, the implementation of this alternative would not meet the requirements of this threshold criterion.

CAA 1 - Comply with Applicable Standards for Waste Management: Since no actions would be performed under this alternative, no wastes would be generated. The requirements of this threshold criterion would be met.

Table 7-1. Summary of Threshold Criteria
CAA 1 – No Action

Evaluation Criteria	Specific Criteria Factor Considerations		
<i>Protect Human Health and the Environment</i>	Would exposure be controlled, reduced, or eliminated?	No	
			No
<i>Attain Media Cleanup Standards</i>	Will cleanup goals for surface exposure be met?	No	
	Will cleanup goals for subsurface exposure be met?	No	
			No
<i>Control Source of Releases</i>	Are further releases reduced or eliminated?	No	
	Is the time frame for attaining the media cleanup standards short?	No	
			No
<i>Comply With Standards for Waste Management</i>	Will waste handling activities be performed in accordance with state and federal regulations?	Yes	
			Yes

Since CAA 1 fails three of the four threshold Criteria, it will not move forward for comparisons to the balancing criteria.

7.2.2 CAA 2 — Physical , Legal , and Administrative Barriers (Land Use Controls)

This alternative involves the restriction of access and activities at the site through the installation of fencing, signage and the development of a LUCP. The detailed analysis of CAA 2 with respect to the four threshold criteria is described in detail below and summarized in Table 7-2.

CAA 2 - Protect Human Health and the Environment: CAA 2 provides fencing, signage, and/or land use controls to reduce the exposure of receptors in SMA 4. The area of SMA 4 is currently inside the fenced and secured area of the facility. The exposure of the authorized visitors (i.e., the maintenance and on-site workers) to the affected media would be reduced through controls such as PPE requirements and dig permits or restrictions that would be outlined in the LUCP. This alternative would not reduce the levels of contamination in in SMA 4 below the cumulative industrial/commercial ELCR of 10⁻⁴ or HI of 1.0; however, the LUCP would prevent complete exposure pathways. Therefore, this threshold criterion would be met.

CAA 2 - Attain Media Cleanup Standards: Subsurface soils exceeding the PCS would be left in place under this scenario; therefore, this threshold criterion would not be met.

CAA 2 - Control the Source of Releases: Because affected media would not be remediated under this CAA, the CAA would not actively reduce the potential, if any, for further releases. Since no active remediation would be conducted under this scenario, cleanup time would be many years. The implementation of this alternative would not meet the requirements of this threshold criterion.

CAA 2 - Comply with Applicable Standards for Waste Management: Since no remedial actions will be performed under this alternative, no wastes will be generated. The requirements of this threshold criterion would be met.

Table 7-2. Summary of Threshold Criteria
CAA 2 – Physical, Legal , and Administrative Barriers (Land Use Controls)

EVALUATION CRITERIA	SPECIFIC CRITERIA FACTOR CONSIDERATIONS		
<i>Protect Human Health and the Environment</i>	Would exposure be controlled, reduced, or eliminated?	Yes	
			Yes
<i>Attain Media Cleanup Standards</i>	Will cleanup goals for surface exposure be met?	Yes	
	Will cleanup goals for subsurface exposure be met?	No	
			No
<i>Control Source of Releases</i>	Are further releases reduced or eliminated?	No	
	Is the time frame for attaining the media cleanup standards short?	No	
			No
<i>Comply With Standards for Waste Management</i>	Will waste handling activities be performed in accordance with state and federal regulations?	Yes	
			Yes

Since CAA 2 fails three of the four threshold Criteria, it will not move forward for comparisons to the balancing criteria.

7.2.3 CAA 3 — Land Use Controls + Groundwater Monitoring

Under this alternative, a long term groundwater monitoring plan would be implemented and a LUCP would be developed. The detailed analysis of CAA 3 with respect to the four threshold criteria is described in detail below and summarized in Table 7-3.

CAA 3 - Protect Human Health and the Environment: CAA 3 provides fencing, signage, and land use controls to reduce the hypothetical exposure of receptors in SMA 4. The area of SMA 4 is currently fenced and secured. The exposure of the authorized visitors (i.e., the maintenance and on-site depot workers) to the affected media will be reduced to acceptable levels through controls such as PPE requirements and dig permits or restrictions that would be outlined in the LUCP. In addition, a long-term groundwater monitoring plan would be prepared. Once approved, the long-term groundwater monitoring would provide information on groundwater concentrations in SMA 4. This alternative would not reduce the levels of contamination in in SMA 4 below the cumulative industrial/commercial ELCR of 10⁻⁴ or HI of 1.0; however, the LUCP would prevent complete exposure pathways. Therefore, this threshold criterion would be met.

CAA 3 - Attain Media Cleanup Standards: Soils exceeding the PCS would be left in place under this scenario; therefore, this threshold criterion would not be met.

CAA 3 - Control the Source of Releases: Because affected media would not be remediated under this CAA, the CAA would not actively reduce the potential, if any, for further releases is not reduced or eliminated. The implementation of this alternative would not meet the requirements of this threshold criterion.

CAA 3 - Comply with Applicable Standards for Waste Management: Purged groundwater would be generated during groundwater monitoring; however, it would be properly managed. Therefore, the requirements of this threshold criterion would be met.

Table 7-3. Summary of Threshold Criteria
CAA 3 – Land Use Controls + Groundwater Monitoring

EVALUATION CRITERIA	SPECIFIC CRITERIA FACTOR CONSIDERATIONS		
<i>Protect Human Health and the Environment</i>	Would exposure be controlled, reduced, or eliminated?	Yes	
			Yes
<i>Attain Media Cleanup Standards</i>	Will cleanup goals for surface exposure be met?	Yes	
	Will cleanup goals for subsurface exposure be met?	No	
			No
<i>Control Source of Releases</i>	Are further releases reduced or eliminated?	No	
	Is the time frame for attaining the media cleanup standards short?	No	
			No
<i>Comply With Standards for Waste Management</i>	Will waste handling activities be performed in accordance with state and federal regulations?	Yes	
			Yes

Since CAA 3 fails three of the four threshold Criteria, it will not move forward for comparisons to the balancing criteria.

7.2.4 CAA 4 — Land Use Controls + In-Situ Soil Source Area Treatment + In-Situ Groundwater Treatment + Groundwater Monitoring

Under this alternative, chemicals or bacteria would be injected into contaminated soil source areas and groundwater in-situ. A long term groundwater monitoring plan would be implemented to monitor the effectiveness of the in-situ treatment, and a LUCP would be developed. The detailed analysis of CAA 4 with respect to the four threshold criteria is described in detail below and summarized in Table 7-4.

CAA 4 - Protect Human Health and the Environment: CAA 4 provides in-situ treatment of the soil source areas and groundwater to minimize the exposure to hypothetical current and future receptors. The exposure of the authorized visitors (i.e., the maintenance and on-site workers) to the affected media would be reduced through controls such as PPE requirements and dig permits or restrictions that would be outlined in the LUCP. In addition, the LUCP would ensure that the

site remains in industrial/commercial use in order to protect any residential receptors. The soil source areas and groundwater have concentrations exceeding the cumulative industrial/commercial ELCR of 10^{-4} or HI of 1.0. The in-situ treatment of the soil source areas and groundwater could reduce the contaminant concentrations to below the cumulative industrial/commercial ELCR of 10^{-4} or HI of 1.0. Land use controls will also be used to block the exposure pathways for otherwise potential future residential receptors. Long term groundwater monitoring would be needed to verify that in-situ treatment achieves the PCSs established for subsurface soil and groundwater. If the in-situ treatment is effective, it would protect human health and the environment. CAA 4 could meet this threshold criteria.

CAA 4 - Attain Media Cleanup Standards: The medium-specific cleanup standards for the soil source areas and groundwater would be achieved by in-situ treatment to reduce concentrations to the PCS (to be confirmed by confirmatory sampling and analysis). The timeframe for obtaining the media cleanup standards would be relatively short compared to natural attenuation depending on the number of injections required to reduce contaminant concentrations to levels below the PCS.

The groundwater plume is approximately 800 feet long by 550 feet wide. The majority of the groundwater flow is limited to a thickness of approximately 3 feet. Based on this estimation there is approximately 2 million gallons of contaminated water. The groundwater velocity of the site is approximately 64 feet per year as calculated during the Phase III RFI. Assuming in-situ treatment of groundwater at the upgradient boundary of the plume and in-situ treatment of the soil source area, it would take approximately 11 years for the in-situ treatment media to travel through the plume to the downgradient boundary. If in-situ treatment media was introduced on the upgradient boundary and at the middle of the plume, the timeframe would be reduced to approximately 4 years. It is likely injection of treatment media would need to occur multiple times since the injected media would be degraded while breaking down the contaminants. Based on these assumptions, the currently estimated timeframe for obtaining the media cleanup standards is 10 to 15 years. The point of compliance to meet the PCS and MCLs is on average throughout the plume. CAA 4 would meet the requirements of this threshold criterion.

CAA 4 - Control the Source of Releases: The in-situ treatment of the soil source areas and groundwater to cleanup standards would more than effectively control any risk of additional groundwater releases. Multiple in-situ injection event over time may be needed. CAA 4 meets the requirement of this threshold criterion.

CAA 4 - Comply with Applicable Standards for Waste Management: All of the wastes generated under this alternative would be managed according to the state and federal regulations associated with treatment. Therefore, the requirements of this threshold criterion would be met.

Table 7-4. Summary of Threshold Criteria
CAA 4 – Land Use Controls + In-Situ Soil Source Area Treatment + In-Situ Groundwater Treatment
+ Groundwater Monitoring

EVALUATION CRITERIA	SPECIFIC CRITERIA FACTOR CONSIDERATIONS		
<i>Protect Human Health and the Environment</i>	Would exposure be controlled, reduced, or eliminated?	Yes	
			Yes
<i>Attain Media Cleanup Standards</i>	Will cleanup goals for surface exposure be met?	Yes	
	Will cleanup goals for subsurface exposure be met?	Yes	
			Yes
<i>Control Source of Releases</i>	Are further releases reduced or eliminated?	Yes	
	Is the time frame for attaining the media cleanup standards short?	Yes	
			Yes
<i>Comply With Standards for Waste Management</i>	Will waste handling activities be performed in accordance with state and federal regulations?	Yes	
			Yes

Since CAA 4 meet the four threshold Criteria, it will move forward for comparisons to the balancing criteria.

7.2.5 CAA 5 — Land Use Controls + In-Situ Soil Source Area Treatment + Groundwater Removal and Treatment + Groundwater Monitoring

CAA 5 includes the in-situ treatment of the soil source areas (including groundwater in the immediate vicinity) and removal and treatment of the contaminated groundwater. A long term groundwater monitoring plan would be implemented to monitor the effectiveness of the remediation, and a LUCP would be developed. The detailed analysis of CAA 5 with respect to the four threshold criteria is described in detail below and summarized in Table 7-5.

CAA 5 - Protect Human Health and the Environment: CAA 5 provides for the in-situ treatment of soil source areas (with ancillary treatment of groundwater) and also provides for the removal and treatment of groundwater, all to minimize the exposure to hypothetical current and future receptors. The exposure of the authorized visitors (i.e., the maintenance and on-site workers) to the affected media would be reduced through controls such as PPE requirements and dig permits or restrictions that would be outlined in the LUCP. In addition, the LUCP would ensure that the site remains in industrial/commercial use in order to protect any residential receptors. The soil source areas and groundwater have concentrations exceeding the PCSs. The in-situ treatment of soil source area could reduce the contaminant concentrations to below the PCSs and prevent recontamination of groundwater. The removal and treatment of the contaminated groundwater will result in removal of contaminants. Land use controls will also be used to block the exposure pathways for otherwise potential future residential receptors. Long term groundwater monitoring would be needed to verify that in-situ soil source area treatment and groundwater removal and treatment achieves the PCSs established for subsurface soil and groundwater. If this combination

of treatments are effective, it would protect human health and the environment. CAA 4 could meet this threshold criteria.

There are no ecological receptors in SMA 4; therefore, ecological risk is not applicable for SMA 4.

CAA 5 - Attain Media Cleanup Standards: The soil source area specific cleanup standards would be expected to be achieved by in-situ soil source area treatment, and the groundwater cleanup standard would be expected to be achieved by hydraulic control and treatment of the groundwater in SMA 4 (although groundwater will receive some ancillary treatment from the in-situ soil source area treatment, as well). The in-situ treatment of the residual contamination in the soil source areas will help achieve the cleanup standards for the subsurface soil. The recovered groundwater will be reused as process water for the plant's light-oil system. The water used in this process is treated through the on-site biological treatment plant. Through this removal of the groundwater contaminants, cleanup standards will be achieved. Soil verification sampling and long-term groundwater monitoring and analysis will be used to verify that CAA 5 is effective.

The groundwater plume is approximately 800 feet long by 550 feet wide. The majority of the groundwater flow is limited to a thickness of approximately 3 feet. Based on this estimation there is approximately 2 million gallons of contaminated water. Currently the hydraulic control system is removing approximately 1.6 million gallons of groundwater per year. Assuming the in-situ treatment of the soil source area could prevent residual contamination leaching from the soil, it would take less than 2 years to remove the entire volume of contaminated water. It is likely injection of treatment media to the soil source areas would need to occur multiple times to completely treat the relevant soil to prevent contaminants from leaching to groundwater. Since groundwater flow is not homogeneous due to the fracture flow, it may take time for some diffusion of contaminants from low flow areas to be captured by the hydraulic control system. Based on these assumptions, the currently estimated timeframe for obtaining the media cleanup standards is 5 to 10 years. The point of compliance to meet the PCS and MCLs is on average throughout the plume. CAA 5 would meet the requirements of this threshold criterion.

CAA 5 - Control the Source of Releases: The in-situ treatment of the soil source areas would more than effectively control any risk of additional releases to groundwater from existing soil conditions. This will allow the hydraulic control to capture and treat the groundwater as needed to achieve cleanup standards. CAA 5 meets the requirement of this threshold criterion.

CAA 5 - Comply with Applicable Standards for Waste Management: The wastes generated under this alternative would be managed according to the state and federal regulations associated with treatment and disposal. Therefore, the requirements of this threshold criterion would be met.

Table 7-5. Summary of Threshold Criteria
CAA 5 – Land Use Controls + In-Situ Soil Source Area Treatment + Groundwater Removal and Treatment + Groundwater Monitoring

EVALUATION CRITERIA	SPECIFIC CRITERIA FACTOR CONSIDERATIONS		
<i>Protect Human Health and the Environment</i>	Would exposure be controlled, reduced, or eliminated?	Yes	
			Yes
<i>Attain Media Cleanup Standards</i>	Will cleanup goals for surface exposure be met?	Yes	
	Will cleanup goals for subsurface exposure be met?	Yes	
			Yes
<i>Control Source of Releases</i>	Are further releases reduced or eliminated?	Yes	
	Is the time frame for attaining the media cleanup standards short?	Yes	
			Yes
<i>Comply With Standards for Waste Management</i>	Will waste handling activities be performed in accordance with state and federal regulations?	Yes	
			Yes

Since CAA 5 meets the four threshold Criteria, it will move forward for comparisons to the balancing criteria.

7.3 Comparative Analysis

This comparative analysis identifies the advantages and disadvantages of each alternative which met the four threshold criteria relative to one another using the balancing criteria to enable the risk managers to identify key tradeoffs. The relative performance of each alternative has been evaluated in relation to each of five balancing criteria: long-term reliability and effectiveness; reduction of toxicity, mobility, or volume of waste; short-term effectiveness; implementability; and cost. The balancing criteria are then scored on a scale of 0 to 5 with high being the highest score. If a particular criteria has more than one question, the average of the ratings are calculated to establish the criteria rating. A maximum balancing criteria score of 25 is possible for each CAA. Since this is only relative based on five of the balancing criteria, the chosen CAA may not receive the highest score. A particular balancing criteria may have an overriding effect on the CAA chosen.

CAA 4 – Land Use Controls + In-Situ Soil Source Area Treatment + In-Situ Groundwater Treatment + Groundwater Monitoring and CAA 5 – Land Use Controls + In-Situ Soil Source Area Treatment + Groundwater Removal and Treatment + Groundwater Monitoring are the only two CAAs to satisfy each of the four threshold criteria of the CAAs evaluated; therefore, CAA 4 and CAA 5 will be evaluated with respect to the five balancing criteria.

7.3.1 Balancing Criteria for CAA 4 — Land Use Controls + In-Situ Soil Source Area Treatment + In-Situ Groundwater Treatment + Groundwater Monitoring

CAA 4 - Long-Term Reliability and Effectiveness: The in-situ treatment of the affected groundwater in SMA 4 would provide an initial reduction in contaminant concentrations; however, the long-term reliability of this treatment is less clear. The potential challenge of reaching all of the contaminated media in fractured bedrock is an additional complication. The long-term groundwater monitoring will assist in evaluating the effectiveness of the in-situ treatment. If multiple treatments were effective, the estimated useful life of the in-situ treatment would be greater than 30 years. CAA 4 partially satisfies this balancing criterion.

CAA 4 - Reduction of Toxicity, Mobility, or Volume of Wastes: CAA 4 effectively reduces the toxicity, mobility, and volume of contaminated groundwater; however, due to the heterogeneity of the site, fully achieving groundwater cleanup standards could be difficult. Therefore, this balancing criterion would be partially satisfied.

CAA 4 - Short-Term Effectiveness: CAA 4 would pose minimal risk to site workers. PPE and proper injection procedures would also minimize any potential risks to site workers during site activities. There are some potential short term environmental risks depending on the type of chemicals or bacteria (much of the time a combination of both) chosen for the in-situ remediation, but those are considered negligible. Short term risk to groundwater would be reduced quickly; however, some “bounce back” may occur. Therefore, this balancing criterion would be partially satisfied.

CAA 4 – Implementability: CAA 4 would be relatively hard to implement. Performing benchscale pilot studies to determine the appropriate chemicals or bacterium to inject can be burdensome. The effectiveness and reliability of in-situ treatment varies based on the heterogeneity of soil and fractures within the bedrock and the effectiveness of delivering the injected material to the targeted media. The design, testing, and implementation of the in-situ injection would require 18 to 24 months to complete; however, it takes 6 months to one year to receive an underground injection control (UIC) permit in Alabama. If additional injection events were required, the estimated time would increase. Therefore, this balancing criterion would be partially satisfied.

CAA 4 – Cost: The capital costs for implementing this alternative include benchscale treatment studies, cost of injected material, cost for UIC permit, cost of delivering injected material to targeted media, and confirmatory sampling of media. Confirmatory sampling, long term groundwater monitoring and LUCP preparation costs would also be incurred for this alternative. The estimated 30-year present cost for CAA 4 is approximately \$680,000.

Table 7-3. Detailed Analysis of Alternatives – Evaluation Summary and Scoring
CAA 4 — Land Use Controls + In-Situ Soil Source Area Treatment + In-Situ Groundwater
Treatment + Groundwater Monitoring

EVALUATION CRITERIA	SPECIFIC CRITERIA FACTOR CONSIDERATIONS	SCORE	
<i>Long-Term Reliability and Effectiveness</i>	How capable is the alternative in providing mitigation or reduction of the severity of the source(s) of potential risk?	5	
	How capable is the alternative in providing long-term protection for receptors through containment systems?	2	
	How capable is the alternative in providing long-term protection for receptors through institutional controls?	5	
			4.0
<i>Reduction of Toxicity, Mobility, or Volume of Waste</i>	How much does the alternative reduce the toxicity of the waste?	3	
	How much does the alternative reduce the mobility of the waste?	2	
	How much does the alternative reduce the volume of the waste?	5	
			3.3
<i>Short-Term Effectiveness</i>	How capable is the alternative at providing short-term effectiveness to address the risk to the community?	5	
	How capable is the alternative at providing short-term effectiveness to address the risk to the workers?	5	
	How capable is the alternative at providing short-term effectiveness to address the risk to the ecological receptors?	5	
			5.0
<i>Implementability</i>	What is the level of difficulty to find adequate TSD services, supplies, and/or equipment?	5	
	What is the level of difficulty to implement, operate, and maintain the chosen technology?	5	
	What is the level of difficulty to implement and maintain the chosen administrative components?	5	
	What is the level of difficulty to implement the alternative in a short time?	5	
			5.0
<i>Cost</i>	Are costs less than \$100,000?	0	
	Are costs less than \$250,000?	0	
	Are costs less than \$500,000?	0	
	Are costs less than \$1,000,000?	5	
	Are costs less than \$2,000,000?	5	
			2.0
		Total	19.3

7.3.2 Balancing Criteria for CAA 5 — Land Use Controls + In-Situ Soil Source Area Treatment + Groundwater Removal and Treatment + Groundwater Monitoring

CAA 5 - Long-Term Reliability and Effectiveness: The hydraulic control and treatment of groundwater in AOC D provides a reliable and long-term corrective measure. The implementation of this alternative would minimize the primary concerns associated with this site. This type of remediation is widely used and is effective and reliable. The estimated useful life of this remediation would be greater than 30 years. Therefore, CAA 5 satisfies this balancing criterion.

CAA 5 - Reduction of Toxicity, Mobility, or Volume of Wastes: CAA 5 effectively reduces the toxicity, mobility, and volume by remediation of contaminated soil in the source areas and groundwater. Therefore, this balancing criterion would be satisfied.

CAA 5 - Short-Term Effectiveness: CAA 5 would pose minimal risk to site workers and the environment by using PPE and proper construction methods such as dust control techniques. The hydraulic control and treatment of groundwater would pose minimal risk to site workers and the environment since the water will be used in the plant process and eventually be treated in the Biological Treatment Facility. The implementation of this alternative would not result in risk to the community. Therefore, this balancing criterion would be satisfied.

CAA 5 – Implementability: CAA 5 would be relatively easily implemented. The necessary equipment, materials, and services for excavation and transport would be readily available. The completion of this alternative would accomplish the corrective measure objectives. The necessary equipment, materials, and services for groundwater hydraulic control are readily available and already installed at the site as part of the Interim Measures for this portion of the facility. Therefore this alternative is, in effect, already being implemented. Therefore, this balancing criterion would be satisfied.

CAA 5 – Cost: The capital costs would include installation of hydraulic control wells, installation of pumps and piping which has already been completed. Additional costs would include benchscale treatment studies, cost of injected material, cost for UIC permit, cost of delivering injected material to targeted media, confirmatory sampling of media, the preparation of a LUCP, and long term groundwater monitoring. The estimated 30-year present cost for CAA 5 is approximately \$600,000.

Table 7-3. Detailed Analysis of Alternatives – Evaluation Summary and Scoring
CAA 5 — Land Use Controls + In-Situ Soil Source Area Treatment + Groundwater Removal and Treatment + Groundwater Monitoring

8.0 JUSTIFICATION AND RECOMMENDATION OF THE CORRECTIVE MEASURES

8.1 Remedy Selection

The foregoing analyses result in the following conclusions:

- COCs exceeded an ELCR of 10^{-6} and an HI of 0.1 in soil and groundwater.
- For the construction worker scenario and industrial worker scenario, the cumulative risk across all media is greater than an ELCR of 10^{-4} and an HI of 1.0.
- For the construction worker scenario and industrial worker scenario, the cumulative risk for subsurface soil exceeds an HI of 1.0, and several constituents exceed an HQ of 0.1 for a construction worker setting.
- A comparison of soil COC concentrations for leachability to soil factors indicate certain exceedances of GWP SSLs in subsurface soils.
- The soil contamination is deemed not to warrant corrective action based on the risk to human health; however, some areas where soil COCs exceed the GWP SSLs are recommended for remediation.
- Active groundwater remediation is also recommended.

Based on these conclusions and a detailed analysis that was performed individually and collectively with respect to the five alternatives, Alternative 5 - Land Use Controls + In-Situ Soil Source Area Treatment + Groundwater Removal and Treatment + Groundwater Monitoring is recommended as the corrective action alternative for SMA 4.

As presented in Section 5.2, the land use controls will include the preparation of a LUCP according to USEPA Region 4 guidance. The purpose of the LUCP is

- To ensure that the groundwater is not used before remediation is complete.
- To ensure that exposure to contaminated soil is mitigated during any future construction projects.
- To ensure that the land use remains industrial/commercial, a scenario that does not pose unacceptable risk based on detected soil concentrations.

The LUCP will also add a layer of protection beyond that needed to address the level of soil contamination identified in the risk assessment. The LUCP will also be:

- consistent with land use controls necessary to deal with contamination above cleanup standards at the other 4 SMAs.
- protective of higher levels of contamination, if any, that may not have been detected by sampling within SMA 5.

- conservative and protective down to one magnitude below the recommended cancer risk level.

The LUCP would identify the objective of the controls to restrict activities within the SMA 5 boundary, list the actions necessary to achieve the objective, and provide notice to onsite individuals of the contaminants at the site. The current and future industrial/commercial worker scenario is actually a very short term “construction-like” worker due to the asphalt, concrete and mineral wool covering SMA 4. It is recommended that the LUCP included, at a minimum, the following controls:

- n A description of the land along with the certified land survey location of the boundary with respect to state plane coordinates,
- n Placing a deed restriction on the property to limit the site to Industrial/Commercial Land Use.
- n An explanation of the land use control including permits to perform any digging activities and the proper personal protective equipment (PPE) that must be used to protect workers, and the use of a fence and signs as necessary to prevent unauthorized access,
- n Identification of the facility program point-of-contact designated responsible for implementing the LUCP,
- n An on-site compliance monitoring program,
- n Notification procedures to USEPA and ADEM whenever the facility anticipates a major change in land use,
- n An annual field inspection and report submitted to USEPA and ADEM to document the effectiveness of the land use controls,
- n A certification of the annual report by the designated official to continue compliance with the LUCP,
- n A procedure to notify USEPA and ADEM immediately upon discovery of any unauthorized major change in land use or any activity inconsistent with the LUCP and the actions that would be implemented to ensure protectiveness, and
- n A procedure to provide advance notification to EPA and ADEM of impending transfer, by sale or lease, of SMA 5.

Soil source areas will be remediated as needed to achieve cleanup standards based on the GWP SSL and the PCSs using in-situ treatment. This will help to prevent any further release of contaminants from the soil to the groundwater and will aid in advancing the groundwater remediation.

The types of biological and chemical in-situ soil source area treatments that will be considered during the Corrective Measures Implementation (CMI) Phase are:

- Sodium sulfite, yeast extract, calcium propionate, nutrient, and micronutrients
- Zero Valent Iron

- Potassium Permanganate
- Hydrogen Peroxide
- Hydrogen Release Compound
- Oxygen Release Compound
- Other Proprietary Chemicals

Groundwater removal and treatment will be conducted on the VOC plume located in SMA 4. Groundwater hydraulic control wells are currently installed in SMA 4 in order to recover contaminated groundwater from AOC D and to control the entire groundwater plume. The hydraulic control well network will continue to be evaluated to ensure that the entire plume shown in Figure 3-1 is controlled. The recovered groundwater is pumped and used as process water which eventually goes into the equalization tanks and is then sent to the ERP Coke Biological Treatment Facility (BTF) for subsequent discharge in compliance with ERP Coke's Clean Water Act NPDES permit.

In addition, long-term groundwater monitoring will occur to assess the effectiveness of the remediation system.

The combination of these alternatives will be the most effective, efficient and economical method to meet the corrective action objectives for SMA 4 and provide long-term protection of human health and the environment.

8.2 Post-Remedy Selection

After EPA issues its Response to Comments (RTC) and Final Decision document selecting the remedy, a Corrective Measures Implementation (CMI) Plan will be needed. The CMI plan will include the following, at a minimum:

- a. A description of the conceptual design, technical features (e.g., plans and specifications, including any treatability studies) and a construction plan for the selected remedy(ies);
- b. A proposed schedule that takes into account all phases of the CMI. The schedule should also include the submittal of documents to support the CMI; and
- c. Requirements for removal and decontamination of units, equipment, devices, and structures that will be used to implement the remedy(ies).

BOLDED concentrations represent detected results.

RSL = USEPA's Regional Screening Levels (USEPA, Nov. 2015)

SSL = Site-specific soil screening levels presented in Appendix G of the Phase III RCRA Facility Investigation Report dated March 2009, prepared by Arcadis and CH2MHill.

1 = No published RSL exists for this chemical; hence, the RSL for pyrene is used as a surrogate.

2 = chemical eliminated as a COPC as the maximum detected concentration does not exceed the RSL

3 = chemical conservatively retained as a COPC because no published screening value is available

4 = chemical retained as a COPC as the maximum detected concentration exceeds the RSL

5 = chemical retained as a COPC because it is included in the group of potentially carcinogenic PAHs and at least one in that group has exceeded its screening level

6 = chemical eliminated as it is measured as a species, rather than the 'total' content

7 = chemical eliminated as it is considered to be a nutritional element

nd = no data

u = not detected

j = estimated

b = chemical detected in the sample and blank

U = qualifier code for nondetected result
J = qualifier code for estimated result
BOLD font indicates a detected chemical concentration.
1 = USEPA, November 2015. Regional Screening Levels (RSLs).
2 = No published RSL exists for this chemical; hence, the RSL for pyrene is used as a surrogate concentration.
3 = chemical retained as a COPC because the maximum concentration exceeds the RSL
4 = chemical excluded as a COPC because the maximum concentration does not exceed the RSL
5 = chemical conservatively retained as a COPC because there is no published RSL
6 = chemical retained as a COPC because it is included in the group of potentially carcinogenic PAHs, and at least one in that group has exceeded its screening level.
7 = Source: USEPA, November 2015, RSL table.

COPC = chemical of potential concern
SSL = groundwater protection soil screening level (Arcadis & CH2MHill, 2009)

U = qualifier code

de for nondetected result

e for estimated result

cates a detected chemical concentration.

vember 2015. Regional Screening Levels (RSLs).

d RSL exists for this chemical; hence, the RSL for pyrene is used as a surrogate concentration.

ained as a COPC because the maximum concentration exceeds the RSL

cluded as a COPC because the maximum concentration does not exceed the RSL

nservatively retained as a COPC because there is no published RSL

ained as a COPC because it is included in the group of potentially carcinogenic PAHs,

ne in that group has exceeded its screening level.

PA, November 2015, RSL table.

result
ult
emical concentration.
gional Screening Levels (RSLs).
is chemical; hence, the RSL for pyrene is used as a surrogate concentration.
ecause the maximum concentration exceeds the RSL
because the maximum concentration does not exceed the RSL
ed as a COPC because there is no published RSL
ecause it is included in the group of potentially carcinogenic PAHs,
is exceeded its screening level.
15, RSL table.

U = qualifier code for nondetected result

J = qualifier code for estimated result

COPC = chemical of potential concern

SSL = groundwater protection soil screening level (Arcadis & CH2MHill, 2009)

BOLD font indicates a detected chemical concentration.

1 = USEPA, November 2015. Regional Screening Levels (RSLs).

2 = No published RSL exists for this chemical; hence, the RSL for pyrene is used as a surrogate concentration.

3 = chemical retained as a COPC because the maximum concentration exceeds the RSL

4 = chemical excluded as a COPC because the maximum concentration does not exceed the RSL

5 = chemical conservatively retained as a COPC because there is no published RSL

6 = chemical retained as a COPC because it is included in the group of potentially carcinogenic PAHs,
and at least one in that group has exceeded its screening level.

7 = Source: USEPA, November 2015, RSL table.

U = qualifier code for nondetected result

J = qualifier code for estimated result

BOLD font indicates a detected chemical concentration.

1 = USEPA, November 2015. Regional Screening Levels (RSLs).

2 = No published RSL exists for this chemical; hence, the RSL for pyrene is used as a surrogate concentration.

3 = chemical retained as a COPC because the maximum concentration exceeds the RSL

4 = chemical excluded as a COPC because the maximum concentration does not exceed the RSL

5 = chemical conservatively retained as a COPC because there is no published RSL

6 = chemical retained as a COPC because it is included in the group of potentially carcinogenic PAHs,
and at least one in that group has exceeded its screening level.

7 = Source: USEPA, November 2015, RSL table.

COPC = chemical of potential concern

SSL = groundwater protection soil screening level (Arcadis & CH2MHill, 2009)

U = qualifier code for nondetected result
J = qualifier code for estimated result
BOLD font indicates a detected chemical concentration.
1 = USEPA, November 2015. Regional Screening Levels (RSLs).
2 = No published RSL exists for this chemical; hence, the RSL for pyrene is used as a surrogate concentration.
3 = chemical retained as a COPC because the maximum concentration exceeds the RSL
4 = chemical excluded as a COPC because the maximum concentration does not exceed the RSL
5 = chemical conservatively retained as a COPC because there is no published RSL
6 = chemical retained as a COPC because it is included in the group of potentially carcinogenic PAHs, and at least one in that group has exceeded its screening level.
7 = Source: USEPA, November 2015, RSL table.

COPC = chemical of potential concern
SSL = groundwater protection soil screening level (Arcadis & CH2MHill, 2009)

ode for nondetected result
COPC = chemical of potential concern
de for estimated result
SSL = groundwater protection soil screening level (Arcadis & CH2MHill, 2009)
licates a detected chemical concentration.
ovember 2015. Regional Screening Levels (RSLs).
ed RSL exists for this chemical; hence, the RSL for pyrene is used as a surrogate concentration.
:tained as a COPC because the maximum concentration exceeds the RSL
xcluded as a COPC because the maximum concentration does not exceed the RSL
onservatively retained as a COPC because there is no published RSL
:tained as a COPC because it is included in the group of potentially carcinogenic PAHs,
one in that group has exceeded its screening level.
iEPA, November 2015, RSL table.

Table 3-2

U = qualifier code for nondetected result COPC = chemical of potential concern
J = qualifier code for estimated result SSL = groundwater protection soil screening level (Arcadis & CH2M Hill, 2009)

BOLD font indicates a detected chemical concentration.

1 = USEPA, November 2015. Regional Screening Levels (RSLs).
2 = No published RSL exists for this chemical; hence, the RSL for pyrene is used as a surrogate concentration.
3 = chemical retained as a COPC because the maximum concentration exceeds the RSL
4 = chemical excluded as a COPC because the maximum concentration does not exceed the RSL
5 = chemical conservatively retained as a COPC because there is no published RSL
6 = chemical retained as a COPC because it is included in the group of potentially carcinogenic PAHs, and at least one in that group has exceeded its screening level.
7 = Source: USEPA, November 2015, RSL table.

UCL = upper confidence limit, as calculated by ProUCL

SSL = groundwater protection soil screening level (Arcadis & CH2MHill, 2009)

nc = not calculated, too few detections to calculate a UCL

1 = No, because the frequency of detection is not > 5%

2 = No, because the 95% UCL < SSL

Bold results are detected concentrations.

USEPA results are presented on the top line per analyte and shaded gray.

USEPA results taken from Sample Analysis Report Revision 5 - Sample Collection and Analysis at the ERP Coke Facility (dated January 23, 2013). Samples collected on May 17, 2012.

ERP Coke results (splits) are presented on the bottom line per analyte and not shaded.

ERP Coke results (splits) taken from TestAmerica Analytical Report document (dated June 1, 2012). Samples collected on May 17, 2012.

nd - no data

RSLs - Regional Screening Levels (USEPA, Nov. 2015)

U - nondetect

J - Result is less than the Reporting Limit (RL) but greater than or equal to the Method Detection Limit (MDL) and the concentration is an estimated value.

B - Analyte was found in the blank and sample.

1 = No published RSL exists for this chemical; hence, the RSL for pyrene is used as a surrogate.

RSL = Regional Screening Levels VISL = Vapor Intrusion Screening Levels

COPC = chemical of potential concern, chemical retained as a COPC if the maximum concentration exceeds the screening level

VISL = Vapor Intrusion Screening Levels, from USEPA, 2014. Vapor Intrusion Screening Level Calculator

nd = no data, chemical is not volatile as presented in the VISL Calculator

1 = screening levels are tapwater USEPA RSLs (Nov. 2015), or maximum contaminant levels for those chemicals without tapwater values.

2 = no published RSL exists for this chemical; hence, the RSL for pyrene is used as a surrogate.

3 = chemical retained as a COPC as the maximum detected concentration exceeds the RSL

4 = chemical eliminated as a COPC as the maximum detected concentration does not exceed the RSL

5 = chemical conservatively retained as a COPC because no published screening value is available

6 = retained as a COPC because it is included in the group of potentially carcinogenic PAHs and at least one in that group has exceeded its screening level

Table 3-5
SMA 4 On-Site Groundwater
Screening for Chemicals of Potential Concern
ERP Coke Facility, Birmingham, AL

RSL = Regional Screening Levels

COPC = chemical of potential concern, chemical retained as a COPC if the maximum concentration exceeds the screening level

VISL = Vapor Intrusion Screening Levels, from USEPA, 2014. Vapor Intrusion Screening Level Calculator

nd = no data, chemical is not volatile as presented in the VISL Calculator

1 = screening levels are tapwater USEPA RSLs (Nov. 2015), or maximum contaminant levels for those chemicals without tapwater values.

2 = no published RSL exists for this chemical; hence, the RSL for pyrene is used as a surrogate.

3 = chemical retained as a COPC as the maximum detected concentration exceeds the RSL

4 = chemical eliminated as a COPC as the maximum detected concentration does not exceed the RSL

5 = chemical conservatively retained as a COPC because no published screening value is available

6 = retained as a COPC because it is included in the group of potentially carcinogenic PAHs and at least one in that group has exceeded its screening level

Table 3-5
SMA 4 On-Site Groundwater
Screening for Chemicals of Potential Concern
ERP Coke Facility, Birmingham, AL

RSL = Regional Screening Levels

COPC = chemical of potential concern, chemical retained as a COPC if the maximum concentration exceeds the screening level

VISL = Vapor Intrusion Screening Levels, from USEPA, 2014. Vapor Intrusion Screening Level Calculator

nd = no data, chemical is not volatile as presented in the VISL Calculator

1 = screening levels are tapwater USEPA RSLs (Nov. 2015), or maximum contaminant levels for those chemicals without tapwater values.

2 = no published RSL exists for this chemical; hence, the RSL for pyrene is used as a surrogate.

3 = chemical retained as a COPC as the maximum detected concentration exceeds the RSL

4 = chemical eliminated as a COPC as the maximum detected concentration does not exceed the RSL

5 = chemical conservatively retained as a COPC because no published screening value is available

6 = retained as a COPC because it is included in the group of potentially carcinogenic PAHs and at least one in that group has exceeded its screening level

Table 3-6
SMA 4 - Summary of Human Exposure Assumptions^a
ERP Coke Facility, Birmingham, Alabama

Exposure Pathway	Parameter	Industrial Worker (Adult)	Construction Worker (Adult)	Adolescent Trespasser	Adult Resident	Child Resident	Parameter Units
General	Body weight (BW)	80	80	47	80	15	kg
	Exposure frequency (EF)	250	250	12	350	350	days/year
	Exposure duration (ED)	25	1	10	26	6	year
	Exposure time (ET)	8	8	1	24	24	hour/day
	Averaging time - Cancer ^b (AT _C)	25,550	25,550	25,550	25,550	25,550	days
	Averaging time - Noncancer ^c (AT _{NC})	9,125	365	3,650	9,490	2,190	days
Exposure Times	Groundwater, dermal, while showering ^d	0.33	na	na	na	na	hour/event
	Groundwater, inhalation while showering ^d	0.25	na	na	na	na	hour/event
	Groundwater, dermal, while trenching ^d	na	2	na	na	na	hours/event
	Groundwater, inhalation while trenching ^d	na	2	na	na	na	hours/event
Ingestion	Soil intake rate (IR _S) ^e	100	330	100	100	200	mg/day
	Drinking water (IR _W)	1	na	na	na	na	L/day
Inhalation	Particle Emission Factor (PEF) ^e	5.70E+09	5.70E+09	5.70E+09	5.70E+09	5.70E+09	m ³ /kg
Dermal Absorption	Skin surface area available for contact (SSA) ^f (includes: face, forearms, and hands)	3,470	3,470	5,595	5,700	2,690	cm ²
	Skin surface area during showering	20,900	na	na	na	na	cm ²
	Soil to skin adherence factor (SAF) ^e	0.12	0.12	0.2	0.07	0.2	mg/cm ²

^(a)Unless otherwise noted, all exposure parameters are obtained from USEPA, 2014 (OSWER Directive 9200.1-120).

^(b)Averaging time of exposure for carcinogenic effects is calculated as follows: 70-year lifetime exposure (70 years x 365 days/year = 25,550 days)

^(c)Averaging time for noncarcinogenic effects is calculated as follows: ED years x 365 days/year

^(d)Professional judgement

^(e)From: USEPA, 2002. *Supplemental Guidance for Developing Soil Screening Levels*.

^(f)From: USEPA, 2004. *RAGS Part E, Dermal Exposure Guidance*.

na = not applicable for this receptor

results are in mg/kg or ppm
U = qualifier code for nondetected result
J = qualifier code for estimated result
BOLD font indicates a detected chemical concentration.

Red Highlighted and bolded font exceeds Preliminary Cleanup Standard (PCS)
Yellow Highlighted and bolded font exceeds Groundwater Protection Standard Soil Screening Levels (GWPS SSL)

Bold results are detected concentrations.

Results are in mg/kg or ppm

USEPA results taken from Sample Analysis Report Revision 5 - Sample Collection and Analysis at the ERP Coke Facility (dated January 23, Samples collected on May 17, 2012.

ERP Coke results (splits) are presented on the bottom line per analyte and not shaded.

ERP Coke results (splits) taken from TestAmerica Analytical Report document (dated June 1, 2012). Samples collected onMay 17, 2012.

Detected Data appear Normal Distributed at 5% Significance Level

Suggested UCL to Use

95% KM (t) UCL	0.109	95% KM (Percentile Bootstrap) UCL	N/A
----------------	-------	-----------------------------------	-----

Warning: One or more Recommended UCL(s) not available!

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.

Recommendations are based upon data size, data distribution, and skewness.

These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).

However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

95% Gamma Approximate KM-UCL (use when $n \geq 50$)	1.186	95% Gamma Adjusted KM-UCL (use when $n < 50$)	1.469

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detected data is small such as < 0.1

For such situations, GROS method tends to yield inflated values of UCLs and BTVs

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Nonparametric Distribution Free UCL Statistics

Detected Data appear Lognormal Distributed at 5% Significance Level

Suggested UCL to Use

97.5% KM (Chebyshev) UCL 0.273

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.

Recommendations are based upon data size, data distribution, and skewness.

These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).

However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

Gamma Kaplan-Meier (KM) Statistics

k hat (KM)	0.0188	nu hat (KM)	6.66
Approximate Chi Square Value (6.66, α)	1.986	Adjusted Chi Square Value (6.66, β)	1.965
95% Gamma Approximate KM-UCL (use when $n \geq 50$)	2074	95% Gamma Adjusted KM-UCL (use when $n < 50$)	2096

Gamma (KM) may not be used when k hat (KM) is < 0.1

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has $> 50\%$ NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detected data is small such as < 0.1

For such situations, GROS method tends to yield inflated values of UCLs and BTVs

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

MLE Mean (bias corrected)	2.886	MLE Sd (bias corrected)	5.453

Gamma Kaplan-Meier (KM) Statistics

k hat (KM)	0.0228	nu hat (KM)	6.124
Approximate Chi Square Value (6.12, α)	1.703	Adjusted Chi Square Value (6.12, β)	1.678
95% Gamma Approximate KM-UCL (use when $n \geq 50$)	3.069	95% Gamma Adjusted KM-UCL (use when $n < 50$)	3.115

Gamma (KM) may not be used when k hat (KM) is < 0.1

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has $> 50\%$ NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detected data is small such as < 0.1

For such situations, GROS method tends to yield inflated values of UCLs and BTVs

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

----------------	-------	-----------------------------------	-------

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.

Recommendations are based upon data size, data distribution, and skewness.

These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).

However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

Approximate Chi Square Value (15.35, α)	7.505	Adjusted Chi Square Value (15.35, β)	7.457
95% Gamma Approximate KM-UCL (use when $n \geq 50$)	1.744	95% Gamma Adjusted KM-UCL (use when $n < 50$)	1.755

Gamma (KM) may not be used when k hat (KM) is < 0.1

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has $> 50\%$ NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detected data is small such as < 0.1

For such situations, GROS method tends to yield inflated values of UCLs and BTVs

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Approximate Chi Square Value (4.29, α)	0.841	Adjusted Chi Square Value (4.29, β)	0.828
95% Gamma Approximate KM-UCL (use when $n \geq 50$)	4.482	95% Gamma Adjusted KM-UCL (use when $n < 50$)	4.551

Gamma (KM) may not be used when k hat (KM) is < 0.1

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has $> 50\%$ NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detected data is small such as < 0.1

For such situations, GROS method tends to yield inflated values of UCLs and BTVs

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Suggested UCL to Use

95% H-UCL	62.51
-----------	-------

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.

These recommendations are based upon the results of the simulation studies summarized in Singh, Singh, and Iaci (2002)

and Singh and Singh (2003). However, simulations results will not cover all Real World data sets.

For additional insight the user may want to consult a statistician.

ProUCL computes and outputs H-statistic based UCLs for historical reasons only.

H-statistic often results in unstable (both high and low) values of UCL95 as shown in examples in the Technical Guide.

It is therefore recommended to avoid the use of H-statistic based 95% UCLs.

Use of nonparametric methods are preferred to compute UCL95 for skewed data sets which do not follow a gamma distribution.

95% Gamma Approximate KM-UCL (use when $n \geq 50$)	0.116	95% Gamma Adjusted KM-UCL (use when $n < 50$)	0.136

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detected data is small such as < 0.1

For such situations, GROS method tends to yield inflated values of UCLs and BTVs

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

95% Gamma Approximate KM-UCL (use when $n \geq 50$)	27606	95% Gamma Adjusted KM-UCL (use when $n < 50$)	28027

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detected data is small such as < 0.1

For such situations, GROS method tends to yield inflated values of UCLs and BTVs

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detected data is small such as < 0.1

For such situations, GROS method tends to yield inflated values of UCLs and BTVs

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detected data is small such as < 0.1

For such situations, GROS method tends to yield inflated values of UCLs and BTVs

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

95% Gamma Approximate KM-UCL (use when $n \geq 50$)	0.139	95% Gamma Adjusted KM-UCL (use when $n < 50$)	0.145

Gamma (KM) may not be used when k hat (KM) is < 0.1

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has $> 50\%$ NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detected data is small such as < 0.1

For such situations, GROS method tends to yield inflated values of UCLs and BTVs

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Minimum	0.0085	Mean	0.0514

Emergency Response, OSWER 9355.4-24. Washington, DC.

na = not applicable

Q/C = inverse of mean concentration at center of source (g/m²-s per kg/m³).

D_A = apparent diffusivity (cm²/sec)

T = exposure interval (sec) for 30 years

CF = conversion factor, 10⁻⁴ m²/cm²

VF = volatilization factor

ρ_b = dry soil bulk density (g/cm³) = 1.5 g/cm³

Total Carcinogenic Risk					Total Noncarcinogenic Risk						
All Pathways and Chemicals =					1.30E-02	All Pathways and Chemical =					3.29E+02

DI = Chemical Daily Intake

SF = Cancer Slope Factor

CR = Cancer Risk

RfD = Noncancer Reference Dose

HQ = Hazard Quotient

nd = no data

na = not applicable

Bold results indicates risk exceeding 1E-06 for carcinogens and greater than 0.1 for noncancer hazards.

†For the inhalation pathway, the Inhalation Unit Risk, with units of (µg/m³)⁻¹, is used as the toxicity value for the carcinogenic evaluation and the Reference Concentration (RfC) with units of µg/m³, for the noncarcinogenic evaluation. Intake via inhalation is quantified by EC, the effective concentration, in units of µg/m³.

Total Carcinogenic Risk						Total Noncarcinogenic Risk				
All Pathways and Chemicals					= 5.62E-04	All Pathways and Chemicals = 3.71E+02				

DI = Chemical Daily Intake

SF = Cancer Slope Factor

CR = Cancer Risk

RfD = Noncancer Reference Dose

HQ = Hazard Quotient

nd = no data

na = not applicable

Bold results indicates risk exceeding 1E-06 for carcinogens and greater than 0.1 for noncancer hazards.

†For the inhalation pathway, the Inhalation Unit Risk, with units of (µg/m³)⁻¹, is used as the toxicity value for the carcinogenic evaluation and the Reference Concentration (RfC) with units of µg/m³, for the noncarcinogenic evaluation. Intake via inhalation is quantified by EC, the effective concentration, in units of µg/m³.

Mutagenic Chemicals

The exposure durations and age-dependent adjustment factors for mutagenic-mode-of-action are listed in the table below:

Note: This section applies to trichloroethylene and other mutagenic chemicals, but not to vinyl chloride.	Age Cohort	Exposure Duration	Age-dependent adjustment factor
	0 - 2 years	2	10
	2 - 6 years	4	3
	6 - 16 years	10	3
	16 - 26 years	10	1

Mutagenic-mode-of-action (MMOA) adjustment factor 25 This factor is used in the equations for mutagenic chemicals.

Vinyl Chloride

See the Navigation Guide equation for Cia,c for vinyl chloride.
